

Increase productivity in optimized office spaces

Office buildings are the second-most common commercial building type and account for the largest share of electricity consumption in the United States, according to the Energy Information Administration.¹ The majority of energy consumption in offices is used by HVAC and lighting. New energy-efficient equipment offers energy and cost savings along with improved operational performance and productivity.

Whether you're upgrading your existing facility or planning a new construction project, we are here to help with rebates for qualifying energy-saving projects. Flip to the back to learn more about how to transform your office space.

Maximize performance and reduce wasted energy.

Energy-efficient equipment facts:

Occupancy sensors and smart lighting systems can save up to 70% of lighting energy in commercial buildings.²

ENERGY STAR® certified computers and monitors are up to 40% more energy-efficient than standard models.³

Upgrading to ENERGY STAR® certified printers, copiers and scanners may generate up to 35% in savings.³

Adjusting the temperature just one degree over an 8-hour period saves 2-3% on heating or cooling costs.⁴

Implement cost-saving measures:

- Integrate occupancy sensors with lighting and HVAC controls to cut energy usage during operational hours.
- Install LED lighting in office spaces for better light quality and reduced glare.
- Add shade screens or window film to office windows to reduce direct heat gain from sunlight.
- Use smart powerstrips to conserve energy used by various plug loads.
- Choose energy-efficient equipment when replacing office appliances like refrigerators, printers and microwaves.
