

Take Charge AZ Pilot for Fleet Charging

Many businesses, government agencies and non-profits have recognized the role they can play in a clean energy future. They are choosing to lead by example and have set sustainability targets for their organizations. Converting fleet vehicles from traditional fuels to electric has multiple benefits:

- Reduces carbon emissions and improves air quality
- Saves money because EVs have an overall lower lifetime cost of ownership
- When charged during the middle of the day, can take advantage of the abundant solar energy we have in AZ
- Improves public image

You can be one-step closer to achieving your sustainability goals by participating in our Fleet Charging pilot.

Customers selected for this pilot will receive the infrastructure necessary to charge up to four fleet vehicles at one time. At no cost to the customer, we will:

- Purchase charging stations – four stations with one plug each
- Install the electrical cable and other equipment necessary to provide power to the charging station
- Establish service and create a dedicated APS account for tracking and billing the energy used by the chargers
- Perform routine equipment checks and respond to any issues
- Help educate staff and/or customers on the benefits of charging fleet vehicles during off-peak hours

This pilot is designed to make converting fleet vehicles to EVs more economical. Customers selected will be responsible for the energy costs associated with charging their vehicles.

Who Qualifies

There are a limited number of free chargers available through this pilot. Ideal candidates for this pilot are customer sites where:

- Chargers are not currently installed
- There is enough space to physically accommodate the chargers
- Vehicles can be charged during off-peak hours
