

Take Charge AZ Pilot for Multifamily Communities

Provide additional value to your residents by offering EV chargers. Charging options for renters are typically to plug-in at work if there are chargers on site or leave their vehicle at a public charging location. Having chargers at your community will encourage the purchase of EVs and can be presented as an added benefit when it's time to renew an agreement. They will also make your community more appealing to future residents who either have an EV or plan to purchase one.

Communities selected for this pilot will receive the infrastructure necessary to charge up to four EVs at one time. At no cost to the customer, we will:

- Purchase the charging stations – two stations with two plugs each
- Install the electrical cable and other equipment necessary to provide power to the charging station
- Establish service and create a dedicated APS account for tracking and billing the energy used by the chargers
- Perform routine equipment checks and quickly respond to any issues
- Help educate residents on the benefits of charging EVs during the middle of the day

This pilot is designed to improve the accessibility to charging stations, but does not provide free charging. Communities selected will be responsible for the energy costs associated with residents charging their vehicles.

Who Qualifies

There are a limited number of free chargers available through this pilot. Applications will be reviewed to determine which communities have the greatest potential to support residents' needs and will contribute to a broader EV charging network in Arizona; therefore, communities that already have chargers will not be considered.

Ideal candidates for this pilot are communities where:

- There is enough space to physically accommodate the chargers
- Residents have EVs or have expressed interest in owning EVs
- Vehicles are parked for extended periods during the middle of the day so that the chargers can be powered by Arizona's abundant solar energy
