

A technician wearing a blue hard hat, safety glasses, and an orange safety vest is working on an air conditioning unit. The technician is looking intently at the unit, which has a circular fan visible. The background shows an industrial setting with various equipment and a bright light source on the right.

Air Conditioning: 5 Signs You Should Upgrade

Is it time to upgrade your air conditioning system? Rebates can help.

Your AC system provides a comfortable and productive business environment, but only if it's working properly. Consider an upgrade if:

1. Employee comfort complaints increase. They could be telling you the AC system is not performing well.
2. Some areas are hotter than others. Check for leaky ducts, poorly designed ductwork or system performance issues.
3. Your AC is noisy. Bad compressor valves, out-of-balance fan blades, low refrigerant charge or vibration due to loose parts are just some causes.
4. You're frequently calling the repairman. Aging equipment can lead to costly repair bills.
5. Your cooling system runs constantly. It may be leaking refrigerant or improperly sized.
