## FOUR CORNERS POWER PLANT POST-CLOSURE PLAN §257.104(d) BOTTOM ASH MONOFILL CH\_PostClosPlan\_001\_20161017

## Post-Closure Plan Contents §257.104(d)(1)

The owner or operator of a CCR unit must prepare a written post-closure plan that includes, at a minimum, the information specified in paragraphs (d)(1)(i) through (iii) of this section.

SITE INFORMATION			
Site Name / Address	Cholla Power Plant / 4801 I-40 Frontage Road,		
	Joseph City, AZ 86032		
Owner Name / Address	Arizona Public Service / 400 North 5 <sup>th</sup> Street,		
	Phoenix, AZ 85004		
CCR Unit	Bottom Ash Monofill (BAM)		
Location	34° 57′ 33″ N, 110° 16′ 57″ W		
Reason for Initiating Closure	Permanent cessation of a coal-fired boiler(s) by a		
	date certain		
Final Cover Type	Evapotranspiration Cover		
Closure Method	Closure by leaving CCR in place		
CLOSURE PLAN DESCRIPTION			
(d)(1)(i) – A description of the monitoring and	A final cover for the BAM CCR landfill (the "CCR		
maintenance activities required in paragraph (b) of	unit") will be constructed over a graded and		
this section for the CCR unit, and the frequency at	prepared subgrade. The subgrade and final cover		
which these activities will be performed.	will be sloped to promote drainage across the		
	surface of the landfill. The final closure		
	configuration will allow water to drain from the		
	top and side slopes into the diversion channels		
	surrounding the BAM. The water collecting in the		
	channels will consist of sheet flow runoff from the		
	top slopes, direct precipitation on the side slope		
	and run-on flows. The system will outfall into a		
	detention basin on the west side of the BAM.		
	The outside slones and ton slone of the closed		
	configuration of the BAM will be monitored for		
	non-native invasive vegetation settlement and/or		
	excessive erosion. Excessive settlement is defined		
	as being present where standing water is in excess		
	of 1 foot in denth over a lateral extent of 1 acre		
	Excessive erocion is defined as an erocion rill or		

scour greater than 1 foot in depth.		
The second state		
The maintenance activities associated with		
Impacted areas are as follows:		
- Inva	sive vegetation	
a)	when invasive vegetation is observed	
	during routine monitoring, it will be	
	removed from the capped surface.	
b)	If a void is created in the cap materials	
	from vegetation removal, the void will	
	be filled with erosion layer soil	
	resources in accordance with the	
	original construction specifications.	
- Settl	ement	
a)	The limits of the settlement area will be delineated.	
b)	The delineated area will be filled to	
	the final elevation with erosion layer	
	soil resources in accordance with the	
	original construction Specifications.	
	Reestablishment of vegetative cover is	
	expected to occur by natural	
	processes.	
- Eros	ion Rills (deeper than 1 foot of erosion	
on a slope)		
a)	The erosion rill will be excavated with	
	a backhoe or track hoe to form a	
	uniform trench width.	
b)	The trench will be filled up to the final	
	elevation with erosion layer soil	
	resources in accordance with the	
	original construction Specifications.	
- Eros	ion Scour (deeper than 1 foot of erosion	
along the bottom of a channel)		
a)	The limits of the erosion scour area	
	will be delineated.	
b)	The trench will be filled up to the final	
	elevation with erosion layer soil	
	resources in accordance with the	
	original construction Specifications.	
c)	The repaired erosion rill area will be	
,	monitored for recurrence of rills. If rills	

reappear, then the site will be assessed for additional measures of erosion resistance.

The drainage collection will be monitored for excessive erosion and sediment build-up. Within the riprap-lined portion of the channel, excessive erosion is defined as displaced riprap with exposed underlying geotextile. Within the soil cement-lined portion of the channel, excessive erosion is not anticipated. However, excessive erosion is defined as broken soil cement with exposed soil subgrade.

The maintenance activities associated with the Drainage Channel are as follows:

- Erosion Within the Riprap-Lined Portions of Channel, if applicable (exposed geotextile)
  - a) The exposed filter materials (graded filter or geotextile) will be inspected for damage, with damaged materials being repaired in accordance with the Specifications.
  - b) The riprap materials will be replaced in accordance with the original construction Specifications.
  - c) If it is determined that the erosion is due to side channel inflow, an inspection will be performed by Engineering Personnel to determine the corrective action, which may include one of the following:
    - i. Regrading adjacent to the channel to prevent the side channel inflow.
    - ii. Addition of a controlled side channel inflow (e.g. a scupper or energy dissipation feature).
- Erosion Within the Soil Cement-Lined Channel, if applicable (deeper than 6 inches)
  - a) The limits of the erosion rill will be delineated.
  - b) The edges and bottom of the rill will

	be clean cut/chipped create vertical		
	edges and flat bottom over the		
	delineated area.		
	c) The prepared area will be filled with a		
	cementitious material (i.e. grout or		
	concrete) with a minimum 7-day		
	strength of 1,100 pounds per square		
	inch (psi). Cementitious materials shall		
	be constructed in accordance with the		
	original construction Specifications.		
	- Sediment Build-up		
	a) If excessive sediment buildup is		
	observed (blockage of 1/3 of the		
	channel cross-section), the sediment		
	will be removed from the channel.		
	b) If the sediment build-up is caused by a		
	side channel flow, an additional		
	sediment trap consisting of a riprap		
	apron may be constructed at the		
	discretion of APS.		
	In accordance with §257.104(d)(2)(iii), this initial		
	written closure plan will be amended to provide		
	additional details after the final engineering design		
	for the grading and cover system is completed.		
	The initial version of the closure plan reflects the		
	information and planning available at the time of		
	issuance.		
(d)(1)(ii) – The name, address, telephone number,	Neal Brown		
and email address of the person or office to	Arizona Public Service		
contact about the facility during the post-closure	400 North 5 <sup>th</sup> Street		
care period.	Phoenix, AZ 85004		
	(602) 250-1000

owner or operator of the CCR unit demonstrates

APS will conduct post-closure care for 30 years after completion of construction activities.

For the first 5 years, APS will perform the monitoring activities described in this report on a quarterly basis. Additionally, APS will monitor for storm water related damage after significant storm events. After the first 5 years and throughout the remaining 25 years, APS will perform the monitoring activities described in this report on an annual basis and after significant storm events.

## Certification Statement 40 CFR § 257.104(d)(4) – Post-Closure Plan for a CCR Landfill

## CCR Unit: Arizona Public Service; Cholla Power Plant; Bottom Ash Monofill

I, Alexander W. Gourlay, being a Registered Professional Engineer in good standing in the State of Arizona, do hereby certify, to the best of my knowledge, information, and belief, that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the information contained in the initial post-closure plan dated August 26, 2016 meets the requirements of 40 CFR § 257.104.
