This Technical Memorandum (Tech Memo) presents the results of a statistical evaluation of groundwater monitoring data collected from monitoring wells downgradient of the Sedimentation Pond (SEDI) located at the Arizona Public Service Company Cholla Power Plant (Site) in Navajo County, Arizona. The statistical evaluation was performed by Wood Environment and Infrastructure Solutions, Inc. (Wood) subcontractor, Geoscience Consulting Strategies LLC (Geoscience Consulting) pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (Federal Register, 2018).

The SEDI is a Site CCR unit that is currently in the assessment monitoring program. The CCR Rule requires the routine evaluation of Appendix IV constituent data collected from SEDI downgradient wells to determine if an Appendix IV constituent exceeds its respective groundwater protection standard (GWPS) at a statistically significant level (SSL). The statistical evaluation documented herein incorporates Appendix IV constituent data collected from SEDI downgradient wells M-56A, M-57A, and M-58A through October 2020 to determine if a GWPS has been exceeded.

2.0 STATISTICAL EVALUATION RESULTS

Attachment A presents the statistical evaluation conducted by Geoscience Consulting. The results of the evaluation are summarized as follows:

- There are currently no GWPS exceedances for Appendix IV constituents at the SEDI downgradient wells.

- A statistically significant decreasing temporal trend is evident for barium and molybdenum at M-56A; and for barium and cobalt at M-57A. A statistically significant increasing temporal trend is evident for arsenic and chromium at M-56A.

- BTVs were updated and are reflected in Table 1 in Attachment A.

3.0 RECOMMENDATIONS

Based on the results of the statistical evaluation presented in Attachment A and pursuant to the CCR Rule, continuation of assessment monitoring at a semiannual frequency for Appendix IV constituents at the SEDI is warranted because there are currently BTV exceedances but no GWPS exceedances. Wood also recommends trend testing after each monitoring event and updates to the BTVs after 1-2 years of future sampling events.

Subject: **CCR Groundwater Assessment Monitoring**
Statistical Evaluation of October 2020 Sedimentation Pond Data
Arizona Public Service Cholla Power Plant– Navajo County, Arizona

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) documents the routine statistical evaluation of assessment monitoring groundwater data collected in October 2020 from the Sedimentation Pond (SEDI) located at the Arizona Public Service (APS) Cholla Power Plant (Cholla) in Navajo County, Arizona. This routine statistical evaluation is completed by Geoscience Consulting Strategies LLC in accordance with the Statistical Data Analysis Work Plan for the Cholla Power Plant and the Coal Combustion Residuals (CCR) Rule (Federal Register, 2018; Wood, 2018).

2.0 STATISTICAL EVALUATION APPROACH

The subject analysis was completed using ProUCL software (United States Environmental Protection Agency, 2015). Appendix A contains the ProUCL data upload table Wood Environment & Infrastructure Solutions, Inc. (Wood) put forth to complete the subject analysis, which includes SEDI compliance well data collected from November 2015 through October 2020. The Appendix IV analytes are listed by name as column headers in the ProUCL data upload table. Each analyte has a corresponding data column (indicated with a "D_" prefix) that indicates if the analyte was detected or not at a concentration that exceeds the analytical reporting limit, where detectable concentrations are symbolized by a "1" and non-detectable concentrations are symbolized by a "0". The non-detectable concentration corresponds to the analyte's reporting limit value for the corresponding sample date. Field and split sample duplicates were retracted from the analysis.

Table 1 presents the concentrations of Appendix IV constituents in samples collected from SEDI background (i.e., M-62A) and compliance monitoring wells (i.e., M-56A, M-57A and M-58A) in October 2020. Additionally, Table 1 reflects updates to BTVs to reflect groundwater samples collected between November 2015 and October 2020. The October 2020 sampling event constitutes the fifth sampling round under the SEDI Groundwater Assessment Monitoring program (Wood, 2019).

Appendix B presents the raw outputs from the Exploratory Data Analysis (EDA) of SEDI Appendix IV groundwater data incorporating the October 2020 sampling event, including temporal trend analysis for

Geoscience Consulting Strategies LLC

Sacramento, CA 95816
Tel: 918-809-2634

constituents exhibiting a non-detect frequency greater than 50%, goodness of fit tests and summary statistics.

3.0 EXCEEDANCE ASSESSMENT

Table 2 summarizes the GWPS for each Appendix IV constituent (Wood, 2019). GWPS selection is documented in the January 2019 Tech Memo and constitutes either the statistically calculated Background Threshold Value (BTV) (Table 1), the US EPA's promulgated Maximum Contaminant Level (MCL) for Drinking Water, or the risk-based alternative GWPS identified for constituents without MCLs, whichever value is higher. Updated BTVs shown in Table 1 were compared to the US EPA's promulgated, or risk-based alternative values. For all Appendix IV constituents (except antimony and lithium) the US EPA's promulgated MCL or the risk-based alternative GWPS is higher than the respective BTV update; therefore, the GWPSs shown in Table 2 reflects the EPA's promulgated values for these constituents. The updated BTV for antimony and lithium are higher than the respective US EPA promulgated, or risk-based alternative value, and constitute the GWPS shown in Table 2.

Table 2 summarizes: 1) compliance well comparisons to their respective GWPS for Appendix IV constituents, 2) which compliance wells exhibit statistically significant temporal trends, and 3) the type of LCL test applied after incorporating the October 2020 sampling event for each monitoring well. The addition of data to the sample population over time can cause the type of statistical test in Table 2 to change from previous evaluations.

This statistical analysis indicates there is insufficient evidence to declare a GWPS exceedance for SEDI monitoring wells M-56A, M-57A, and M-58A at the current time.

Several compliance monitoring wells exhibit statistically significant ($p<0.05$) temporal trends with no SSI declaration, including statistically significant ($p<0.05$) decreasing temporal trends in M-56A (barium and molybdenum) and M-57A (barium and cobalt) in addition to statistically significant ($p<0.05$) increasing temporal trends in M-56A (arsenic and chromium).

4.0 RECOMMENDATION

The SEDI should continue Assessment Monitoring in accordance with 40 Code of Federal Regulations Section 257.95(f) (Federal Register, 2018).

Future laboratory reporting limits should be equal to, or below, the respective BTVs to make sample concentration comparisons (Table 1) meaningful (Wood, 2018).

Goodness of Fit Statistics

	Goodness-of-Fit Test Statistics for Data Sets with Non-Detects
User Selected Options	
Date/Time of Computation	ProUCL 5.13/16/2021 1:23:07 PM
From File	Cholla_SEDIAppendixIV_ProUCL_Q12021_20210316v2_b.xls
Full Precision	OFF
Confidence Coefficient	0.95

Antimony (m-62a)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	22	5	17	0	17	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Antimony (m-62a) was not processed!

1% critical value: 0.524

1. Observation Value 0.01 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.842

For 10% significance level, 0.01 is an outlier.
For 5% significance level, 0.01 is an outlier.
For 1% significance level, 0.01 is an outlier.

2. Observation Value 0.0005 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.000

For 10% significance level, 0.0005 is not an outlier.
For 5% significance level, 0.0005 is not an outlier.
For 1% significance level, 0.0005 is not an outlier.

Dixon's Outlier Test for Molybdenum (m-56a)

Number of Observations = 21
10% critical value: 0.391
5% critical value: 0.44
1% critical value: 0.524

1. Observation Value 0.029 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.379

For 10% significance level, 0.029 is not an outlier.
For 5% significance level, 0.029 is not an outlier.
For 1% significance level, 0.029 is not an outlier.

2. Observation Value 0.0057 is a Potential Outlier (Lower Tail)?

Appendix B
Outlier Statistics

5% critical value: 0.44

Test Statistic: 0.144

For 10% significance level, 0.0057 is not an outlier.
For 5% significance level, 0.0057 is not an outlier.
For 1% significance level, 0.0057 is not an outlier.

Dixon's Outlier Test for Molybdenum (m-57a)

Number of Observations = 21
10% critical value: 0.391
5% critical value: 0.44
1% critical value: 0.524

1. Observation Value 0.022 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.515

For 10% significance level, 0.022 is an outlier.
For 5% significance level, 0.022 is an outlier.
For 1% significance level, 0.022 is not an outlier.

2. Observation Value 0.0011 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.138

For 10% significance level, 0.0011 is not an outlier.
For 5% significance level, 0.0011 is not an outlier.
For 1% significance level, 0.0011 is not an outlier.

Dixon's Outlier Test for Molybdenum (m-58a)

Number of Observations = 21
10% critical value: 0.391
5% critical value: 0.44
1% critical value: 0.524

Appendix B
Outlier Statistics

5% critical value: 0.44							
1. Observation Value 0.02 is a Potential Outlier (Upper Tail)?							
Test Statistic: 0.832							
For 10% significance level, 0.02 is an outlier.							
For 5% significance level, 0.02 is an outlier.							
For 1% significance level, 0.02 is an outlier.							
2. Observation Value 0.0014 is a Potential Outlier (Lower Tail)?							
Test Statistic: 0.061							
For 10% significance level, 0.0014 is not an outlier.							
For 5% significance level, 0.0014 is not an outlier.							
For 1% significance level, 0.0014 is not an outlier.							
Dixon's Outlier Test for Total Radium (m-56a)							
Number of Observations = 18							
10% critical value: 0.424							
5% critical value: 0.475							
1% critical value: 0.561							
1. Observation Value 1.9 is a Potential Outlier (Upper Tail)?							
Test Statistic: 0.143							
For 10% significance level, 1.9 is not an outlier.							
For 5% significance level, 1.9 is not an outlier.							
For 1% significance level, 1.9 is not an outlier.							
2. Observation Value 0.4 is a Potential Outlier (Lower Tail)?							
Test Statistic: 0.077							
For 10% significance level, 0.4 is not an outlier.							
For 5% significance level, 0.4 is not an outlier.							
For 1% significance level, 0.4 is not an outlier.							

Appendix B
Outlier Statistics

5% critical value: 0.44

Dixon's Outlier Test for Total Radium (m-57a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 1.5 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.667

For 10% significance level, 1.5 is an outlier.
For 5% significance level, 1.5 is an outlier.
For 1% significance level, 1.5 is an outlier.

2. Observation Value 0.4 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.400

For 10% significance level, 0.4 is not an outlier.
For 5% significance level, 0.4 is not an outlier.
For 1% significance level, 0.4 is not an outlier.

Dixon's Outlier Test for Total Radium (m-58a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 2.6 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.350

For 10% significance level, 2.6 is not an outlier.
For 5% significance level, 2.6 is not an outlier.

Appendix B
Outlier Statistics

5% critical value: 0.44
For 1% significance level, 2.6 is not an outlier.

2. Observation Value 0.5 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.071

For 10% significance level, 0.5 is not an outlier.
For 5% significance level, 0.5 is not an outlier.
For 1% significance level, 0.5 is not an outlier.

Wood Technical Memorandum Documenting the Statistical Analysis of Appendix IV Constituent Data Collected for the SEDI Through April 2021

Technical Memorandum

To:	Arizona Public Service Company	**File No:**	14-2021-2008
From:	Mari Wuollet	**Reviewed by:**	Maren Henley, PE
Date:	October 13, 2021		

Subject: **CCR GROUNDWATER ASSESSMENT MONITORING**
STATISTICAL EVALUATION OF APPENDIX IV CONSTITUENT DATA
COLLECTED FROM THE SEDIMENTATION POND THROUGH APRIL 2021
Arizona Public Service Company Cholla Power Plant – Navajo County, Arizona

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) presents the results of a statistical evaluation of groundwater monitoring data collected from monitoring wells downgradient of the Sedimentation Pond (SEDI) located at the Arizona Public Service Company (APS) Cholla Power Plant (Site) in Navajo County, Arizona. The statistical evaluation was performed by Geoscience Consulting Strategies LLC (Geoscience Consulting), a subcontractor to Wood Environment and Infrastructure Solutions, Inc. (Wood) pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (CCR Rule) (Federal Register, 2020).

The SEDI is a Site CCR unit that is currently in the assessment monitoring program. The CCR Rule requires ongoing evaluation on a semiannual basis of Appendix IV constituent data collected from SEDI downgradient wells to determine if an Appendix IV constituent exceeds its respective groundwater protection standard (GWPS) at a statistically significant level (SSL). The statistical evaluation documented herein incorporates Appendix IV constituent data collected from SEDI downgradient wells M-56A, M-57A, and M-58A through April 2021 to determine if a GWPS has been exceeded.

2.0 STATISTICAL EVALUATION RESULTS

Attachment A presents the statistical evaluation conducted by Geoscience Consulting. The results of the evaluation are summarized as follows:

- There are currently no GWPS exceedances for Appendix IV constituents at the SEDI downgradient wells.

- A statistically significant decreasing temporal trend is evident for barium and molybdenum at M-56A; and for arsenic, barium, and cobalt at M-57A. A statistically significant increasing temporal trend is evident for arsenic and chromium at M-56A; and for arsenic at M-58A.

Fax: (602) 733-6100
www.woodplc.com

3.0 RECOMMENDATIONS

Based on the results of the statistical evaluation presented in Attachment A and pursuant to the CCR Rule, there are currently no GWPS exceedances or exceedances of respective background threshold values in Appendix IV constituent concentrations based on evaluation of the groundwater monitoring data collected in April 2021.

Continuation of assessment monitoring at a semiannual frequency for Appendix IV constituents at the SEDI is warranted until CCR has been removed from the unit (in accordance with the Closure Plan) and Appendix IV concentrations are below GWPSs for two consecutive sampling events. Wood recommends trend testing after each monitoring event and updates to the statistical method selection and BTVs after 1-2 years of future sampling events (as warranted).

Subject: **CCR Groundwater Assessment Monitoring**
Statistical Evaluation of April 2021 Sedimentation Pond Data
Arizona Public Service Company Cholla Power Plant– Navajo County, Arizona

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) documents the routine statistical evaluation of assessment monitoring groundwater data collected in April 2021 from the Sedimentation Pond (SEDI) located at the Arizona Public Service Company (APS) Cholla Power Plant (Cholla) in Navajo County, Arizona. This routine statistical evaluation is completed by Geoscience Consulting Strategies LLC in accordance with the Statistical Data Analysis Work Plan (SDAWP) for the Cholla Power Plant and the Coal Combustion Residuals (CCR) Rule (Federal Register, 2018; Wood, 2018).

2.0 STATISTICAL EVALUATION APPROACH

The subject analysis was completed using ProUCL software (United States Environmental Protection Agency [US EPA], 2015). Appendix A contains the ProUCL data upload table Wood Environment & Infrastructure Solutions, Inc. (Wood) put forth to complete the subject analysis, which includes SEDI compliance well data collected from November 2015 through April 2021. The Appendix IV analytes are listed by name as column headers in the ProUCL data upload table. Each analyte has a corresponding data column (indicated with a "D_" prefix) that indicates if the analyte was detected or not at a concentration that exceeds the analytical reporting limit, where detectable concentrations are symbolized by a "1" and non-detectable concentrations are symbolized by a "0". The non-detectable concentration corresponds to the analyte's reporting limit value for the corresponding sample date. Field and split sample duplicates were retracted from the analysis.

Table 1 presents the concentrations of Appendix IV constituents in samples collected from SEDI background (i.e., M-62A) and compliance monitoring wells (i.e., M-56A, M-57A and M-58A) in April 2021. Additionally, Table 1 reflects BTVs that reflect groundwater samples collected between November 2015 and October 2020. The April 2021 sampling event constitutes the sixth sampling round under the SEDI Groundwater Assessment Monitoring program (Wood, 2019).

Appendix B presents the raw outputs from the Exploratory Data Analysis (EDA) of SEDI Appendix IV groundwater data incorporating the April 2021 sampling event, including temporal trend analysis for constituents exhibiting a non-detect frequency less than 50%, goodness of fit tests and summary statistics.

3.0 EXCEEDANCE ASSESSMENT

Table 2 summarizes the Groundwater Protection Standards (GWPS) for each Appendix IV constituent (Wood, 2019). GWPS selection is documented in the January 2019 Tech Memo and constitutes either the statistically calculated Background Threshold Value (BTV) (Table 1), the US EPA's promulgated Maximum Contaminant Level (MCL) for Drinking Water, or the risk-based alternative GWPS identified for constituents without MCLs, whichever value is highest. The updated BTV for antimony and lithium are higher than the respective US EPA promulgated, or risk-based alternative value, and constitute the GWPS shown in Table 2.

Table 2 summarizes: 1) compliance well comparisons to their respective GWPS for Appendix IV constituents, 2) which compliance wells exhibit statistically significant temporal trends, and 3) the type of LCL test applied after incorporating the April 2021 sampling event for each monitoring well. The addition of data to the sample population over time can cause the type of statistical test in Table 2 to change from previous evaluations.

This statistical analysis indicates there is insufficient evidence to declare a GWPS exceedance for SEDI monitoring wells M-56A, M-57A, and M-58A at the current time.

Several compliance monitoring wells exhibit statistically significant ($p<0.05$) temporal trends, including statistically significant ($p<0.05$) decreasing temporal trends in M-56A (barium and molybdenum) and M-57A (arsenic, barium and cobalt) in addition to statistically significant ($p<0.05$) increasing temporal trends in M-56A (arsenic and chromium) and M-58A (arsenic). Temporal trends can be present without an SSI exceedance because the current concentration trends fall below their respective GWPS.

4.0 RECOMMENDATION

The SEDI should continue Assessment Monitoring in accordance with 40 Code of Federal Regulations Section 257.95(f) (Federal Register, 2018).

Future laboratory reporting limits should be equal to, or below, the respective BTVs to make sample concentration comparisons (Table 1) meaningful (Wood, 2018).

Notes:
Constituent concentrations that exceed BTVs are presented in bold text.

*The non-detectable sample concentration exceeds the corresponding BTV.

Acronyms:
--- = not applicable or evaluated
BTV = Background Threshold Value
mg/L = milligrams per liter
NA = not available at the time of assessment
SU = standard units
NS = no standard
pCi/L = picocuries per liter
< = sample concentration below the reporting limit value
SEDI = Sedimentation Pond
TDS = total dissolved solids

Goodness of Fit Statistics

	Goodness-of-Fit Test Statistics for Data Sets with Non-Detects
User Selected Options	
Date/Time of Computation	ProUCL 5.19/6/2021 3:15:12 PM
From File	Cholla_SEDI_ProUCL_Jul2021.xls
Full Precision	OFF
Confidence Coefficient	0.95

Antimony (m-56a)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	23	5	18	1	17	94.44%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Antimony (m-56a) was not processed!

Antimony (m-57a)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	24	6	18	1	17	94.44%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Antimony (m-57a) was not processed!

Antimony (m-58a)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	23	5	18	0	18	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Appendix B

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!								
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!								
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).								
The data set for variable Lead (m-56a) was not processed!

Mercury (m-56a)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	23	5	18	0	18	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Mercury (m-56a) was not processed!

Dixon's Outlier Test for Arsenic (m-56a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.01 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.161

For 10% significance level, 0.01 is not an outlier.
For 5% significance level, 0.01 is not an outlier.
For 1% significance level, 0.01 is not an outlier.

2. Observation Value 0.0006 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.010

For 10% significance level, 0.0006 is not an outlier.
For 5% significance level, 0.0006 is not an outlier.
For 1% significance level, 0.0006 is not an outlier.

Dixon's Outlier Test for Arsenic (m-57a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.021 is a Potential Outlier (Upper Tail)?

Appendix B
Outlier Statistics

5% critical value: 0.43
Test Statistic: 0.754

For 10% significance level, 0.021 is an outlier.
For 5% significance level, 0.021 is an outlier.
For 1% significance level, 0.021 is an outlier.

2. Observation Value 0.0017 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.041

For 10% significance level, 0.0017 is not an outlier.
For 5% significance level, 0.0017 is not an outlier.
For 1% significance level, 0.0017 is not an outlier.

Dixon's Outlier Test for Arsenic (m-58a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.01 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.557

For 10% significance level, 0.01 is an outlier.
For 5% significance level, 0.01 is an outlier.
For 1% significance level, 0.01 is an outlier.

2. Observation Value 0.0025 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.139

For 10% significance level, 0.0025 is not an outlier.
For 5% significance level, 0.0025 is not an outlier.
For 1% significance level, 0.0025 is not an outlier.

Appendix B
Outlier Statistics

5% critical value: 0.43

Dixon's Outlier Test for Barium (m-56a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.086 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.118

For 10% significance level, 0.086 is not an outlier.
For 5% significance level, 0.086 is not an outlier.
For 1% significance level, 0.086 is not an outlier.

2. Observation Value 0.05 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.062

For 10% significance level, 0.05 is not an outlier.
For 5% significance level, 0.05 is not an outlier.
For 1% significance level, 0.05 is not an outlier.

Dixon's Outlier Test for Barium (m-57a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.072 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.548

For 10% significance level, 0.072 is an outlier.
For 5% significance level, 0.072 is an outlier.
For 1% significance level, 0.072 is an outlier.

Appendix B

For 1% significance level, 0.8 is not an outlier.

2. Observation Value 0.39 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.024

For 10% significance level, 0.39 is not an outlier.
For 5% significance level, 0.39 is not an outlier.
For 1% significance level, 0.39 is not an outlier.

Dixon's Outlier Test for Fluoride (m-57a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

Appendix B
Outlier Statistics

5% critical value: 0.43

1. Observation Value 0.8 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.000

For 10% significance level, 0.8 is not an outlier.
For 5% significance level, 0.8 is not an outlier.
For 1% significance level, 0.8 is not an outlier.

2. Observation Value 0.35 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.111

For 10% significance level, 0.35 is not an outlier.
For 5% significance level, 0.35 is not an outlier.
For 1% significance level, 0.35 is not an outlier.

Dixon's Outlier Test for Fluoride (m-58a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.8 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.000

For 10% significance level, 0.8 is not an outlier.
For 5% significance level, 0.8 is not an outlier.
For 1% significance level, 0.8 is not an outlier.

2. Observation Value 0.32 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.167

For 10% significance level, 0.32 is not an outlier.
For 5% significance level, 0.32 is not an outlier.

Appendix B
Outlier Statistics

5% critical value: 0.43
For 1% significance level, 0.32 is not an outlier.

Dixon's Outlier Test for Lead (m-56a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 0.01 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.842

For 10% significance level, 0.01 is an outlier.
For 5% significance level, 0.01 is an outlier.
For 1% significance level, 0.01 is an outlier.

2. Observation Value 0.0001 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.211

For 10% significance level, 0.0001 is not an outlier.
For 5% significance level, 0.0001 is not an outlier.
For 1% significance level, 0.0001 is not an outlier.

Dixon's Outlier Test for Lead (m-57a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 0.01 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.842

For 10% significance level, 0.01 is an outlier.

Appendix B
Outlier Statistics

5% critical value: 0.43
For 5% significance level, 0.01 is an outlier.
For 1% significance level, 0.01 is an outlier.

2. Observation Value 0.00021 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.162

For 10% significance level, 0.00021 is not an outlier.
For 5% significance level, 0.00021 is not an outlier.
For 1% significance level, 0.00021 is not an outlier.

Dixon's Outlier Test for Lead (m-58a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 0.01 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.842

For 10% significance level, 0.01 is an outlier.
For 5% significance level, 0.01 is an outlier.
For 1% significance level, 0.01 is an outlier.

2. Observation Value 0.0001 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.211

For 10% significance level, 0.0001 is not an outlier.
For 5% significance level, 0.0001 is not an outlier.
For 1% significance level, 0.0001 is not an outlier.

Dixon's Outlier Test for Lithium (m-56a)

Number of Observations = 19

Appendix B
Outlier Statistics

5% critical value: 0.43
10% critical value: 0.412
5% critical value: 0.462
1% critical value: 0.547

1. Observation Value 1 is a Potential Outlier (Upper Tail)?

Test Statistic: 1.000

For 10% significance level, 1 is an outlier.
For 5% significance level, 1 is an outlier.
For 1% significance level, 1 is an outlier.

2. Observation Value 0.097 is a Potential Outlier (Lower Tail)?

Test Statistic: 1.000

For 10% significance level, 0.097 is an outlier.
For 5% significance level, 0.097 is an outlier.
For 1% significance level, 0.097 is an outlier.

Dixon's Outlier Test for Lithium (m-57a)

Number of Observations = 19
10% critical value: 0.412
5% critical value: 0.462
1% critical value: 0.547

1. Observation Value 1 is a Potential Outlier (Upper Tail)?

Test Statistic: 1.000

For 10% significance level, 1 is an outlier.
For 5% significance level, 1 is an outlier.
For 1% significance level, 1 is an outlier.

2. Observation Value 0.092 is a Potential Outlier (Lower Tail)?

Test Statistic: 1.000

Appendix B
Outlier Statistics

5% critical value: 0.43

For 10% significance level, 0.092 is an outlier.
For 5% significance level, 0.092 is an outlier.
For 1% significance level, 0.092 is an outlier.

Dixon's Outlier Test for Lithium (m-58a)

Number of Observations = 19
10% critical value: 0.412
5% critical value: 0.462
1% critical value: 0.547

1. Observation Value 1 is a Potential Outlier (Upper Tail)?

Test Statistic: 1.000

For 10% significance level, 1 is an outlier.
For 5% significance level, 1 is an outlier.
For 1% significance level, 1 is an outlier.

2. Observation Value 0.07 is a Potential Outlier (Lower Tail)?

Test Statistic: 1.000

For 10% significance level, 0.07 is an outlier.
For 5% significance level, 0.07 is an outlier.
For 1% significance level, 0.07 is an outlier.

Dixon's Outlier Test for Mercury (m-56a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 0.0002 is a Potential Outlier (Upper Tail)?

Appendix B
Outlier Statistics

5% critical value: 0.43
Test Statistic: NaN

For 10% significance level, 0.0002 is an outlier.
For 5% significance level, 0.0002 is an outlier.
For 1% significance level, 0.0002 is an outlier.

2. Observation Value 0.0002 is a Potential Outlier (Lower Tail)?

Test Statistic: NaN

For 10% significance level, 0.0002 is an outlier.
For 5% significance level, 0.0002 is an outlier.
For 1% significance level, 0.0002 is an outlier.

Dixon's Outlier Test for Mercury (m-57a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 0.0002 is a Potential Outlier (Upper Tail)?

Test Statistic: NaN

For 10% significance level, 0.0002 is an outlier.
For 5% significance level, 0.0002 is an outlier.
For 1% significance level, 0.0002 is an outlier.

2. Observation Value 0.0002 is a Potential Outlier (Lower Tail)?

Test Statistic: NaN

For 10% significance level, 0.0002 is an outlier.
For 5% significance level, 0.0002 is an outlier.
For 1% significance level, 0.0002 is an outlier.

Appendix B
Outlier Statistics

5% critical value: 0.43

Dixon's Outlier Test for Mercury (m-58a)

Number of Observations = 18
10% critical value: 0.424
5% critical value: 0.475
1% critical value: 0.561

1. Observation Value 0.0002 is a Potential Outlier (Upper Tail)?

Test Statistic: NaN

For 10% significance level, 0.0002 is an outlier.
For 5% significance level, 0.0002 is an outlier.
For 1% significance level, 0.0002 is an outlier.

2. Observation Value 0.0002 is a Potential Outlier (Lower Tail)?

Test Statistic: NaN

For 10% significance level, 0.0002 is an outlier.
For 5% significance level, 0.0002 is an outlier.
For 1% significance level, 0.0002 is an outlier.

Dixon's Outlier Test for Molybdenum (m-56a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.029 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.379

For 10% significance level, 0.029 is not an outlier.
For 5% significance level, 0.029 is not an outlier.
For 1% significance level, 0.029 is not an outlier.

Appendix B
Outlier Statistics

5% critical value: 0.43

2. Observation Value 0.0057 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.144

For 10% significance level, 0.0057 is not an outlier.
For 5% significance level, 0.0057 is not an outlier.
For 1% significance level, 0.0057 is not an outlier.

Dixon's Outlier Test for Molybdenum (m-57a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

1. Observation Value 0.022 is a Potential Outlier (Upper Tail)?

Test Statistic: 0.515

For 10% significance level, 0.022 is an outlier.
For 5% significance level, 0.022 is an outlier.
For 1% significance level, 0.022 is an outlier.

2. Observation Value 0.0011 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.138

For 10% significance level, 0.0011 is not an outlier.
For 5% significance level, 0.0011 is not an outlier.
For 1% significance level, 0.0011 is not an outlier.

Dixon's Outlier Test for Molybdenum (m-58a)

Number of Observations = 22
10% critical value: 0.382
5% critical value: 0.43
1% critical value: 0.514

Appendix B
Outlier Statistics

5% critical value: 0.43
1. Observation Value 0.02 is a Potential Outlier (Upper Tail)?
Test Statistic: 0.832
For 10% significance level, 0.02 is an outlier.
For 5% significance level, 0.02 is an outlier.
For 1% significance level, 0.02 is an outlier.
2. Observation Value 0.0014 is a Potential Outlier (Lower Tail)?
Test Statistic: 0.061
For 10% significance level, 0.0014 is not an outlier.
For 5% significance level, 0.0014 is not an outlier.
For 1% significance level, 0.0014 is not an outlier.
Dixon's Outlier Test for Total Radium (m-56a)
Number of Observations = 19
10% critical value: 0.412
5% critical value: 0.462
1% critical value: 0.547
1. Observation Value 1.9 is a Potential Outlier (Upper Tail)?
Test Statistic: 0.143
For 10% significance level, 1.9 is not an outlier.
For 5% significance level, 1.9 is not an outlier.
For 1% significance level, 1.9 is not an outlier.
2. Observation Value 0.4 is a Potential Outlier (Lower Tail)?
Test Statistic: 0.077
For 10% significance level, 0.4 is not an outlier.
For 5% significance level, 0.4 is not an outlier.

Appendix B

Operations Inspection of the Fly Ash Pond Seepage Intercept Systems

Technical Memorandum

To:	Arizona Public Service	**Project No:**	14-2018-2040
By:	Becky Weaver, PE	**Reviewed by:**	Andrea Kagie-Hay, PE Maren Henley, PE Robert Kozojet
Tel:	(602) 733-6000	**CC:**	File
Date:	January 24, 2022		

Re: **OPERATIONS INSPECTION OF THE FLY ASH POND SEEPAGE INTERCEPT SYSTEMS**
Arizona Public Service Company, Cholla Power Plant – Joseph City, AZ

1.0 INTRODUCTION

This Technical Memorandum documents the information gathered prior to and during an inspection of seepage intercept system operations at the Fly Ash Pond (FAP), located at the Arizona Public Service Company (APS) Cholla Power Plant in Navajo County, Arizona. The primary objective of this effort was to understand the operational capacity of the existing seepage collection network to evaluate how the existing systems could be incorporated into a future remedy for corrective action and to assist in the selection of design changes to the system.

The following sections present a summary and results of the inspection of operations for the FAP seepage intercept systems performed during a site visit in late June 2021.

2.0 BACKGROUND

There are two seepage intercept systems associated with the FAP: the Geronimo Seepage Intercept System and the Hunt Seepage Intercept System. These systems were originally installed in the early 1990s in the vicinity of the base of the FAP, with Geronimo north of the I-40 Interstate (Figure 1) and Hunt south of the I-40 Interstate (Figure 2). Each system consists of a drainage trench or trenches connecting to collection sumps and shallow extraction well(s) all pumping to a common header system. The drainage trenches are constructed of non-woven geotextile wrapped around drainage rock and contain a 4-inch (in) perforated high-density polyethylene (HDPE) pipe running along the bottom of each trench. The trench system diverts captured seepage water to the collection sumps. Each trench was designed up to 4 to 6 feet (ft) deep and covered with a minimum of 6 inches of native soil cover.

The Geronimo Seepage Intercept System originally consisted of two extraction wells that are approximately 40 ft deep (Geronimo A [GSX-1] and B [GSX-2]) and two shallow dewatering sumps approximately 10 ft deep (Geronimo C [GSX-3] and D [GSX-4]). The wells and the sumps are screened in the alluvium. The length of the Geronimo seepage trenches are approximately 350 ft to Sump C and 200 ft to Sump D (Figure 1).

www.woodplc.com

Attachment B contains the system drawings including the piping and instrumentation diagram (P&ID) and general layout of the original systems.

In the past, flow from the Geronimo Seepage Intercept System was collected and pumped back up into the FAP; however, collected seepage water is currently returned to the plant via a valved connection to a larger (estimated size of 6 in) pipe via gravity. The connection into the FAP is still available; however, with the elevation difference, the pipe and opening at the top acts as an air break to allow gravity flow to the plant when the valve to the plant is open (current operating conditions).

At the time of the site visit, the two extraction wells had been removed and abandoned and a single extraction well had been installed, but not equipped as a replacement (GSX-1R).

The Hunt Seepage Intercept System is comprised of a shallow seepage intercept trench that discharges to a dewatering sump (Hunt A [HSX-1]) that was dry at the time of the site visit, and an extraction well (Hunt B [HSX-2]). The length of the Hunt seepage trench is approximately 460 ft long (Figure 2).

There are two flow meters (propeller or turbine-style) that are installed on piping that receives flow from the Geronimo and Hunt seepage systems, both located north of I-40 on the discharge piping that collects the FAP Seepage flows and returns them to the Plant. One of the flow meters is located on the piping that collects flow from just the Hunt portion of the system (Hunt A and B). The second flow meter is located on the piping that collects flow from the entire system including both the Hunt portion (Hunt A and B) and the Geronimo portion (Geronimo C and D).

The average pumping rate of the Hunt and Geronimo Seepage Intercept Systems over the past five years ranges from near zero to 20 gallons per minute (gpm) based on the shared flow meter that measures flow for both systems, although there is some evidence that the existing flow meters are not always recording accurate flows. The average pumping rate from the Geronimo Seepage Intercept System has declined concurrent with recent efforts to promote decreases in the water level elevation at the FAP.

3.0 INSPECTION SUMMARY

On June 23-25, 2021, Wood personnel conducted a site visit to inspect each seepage intercept system and to conduct basic operational testing. Each accessible system was tested for operation pressure, flow rates, dead head pressure and pump control operations. The approximate flow rate for each pump (when not discharging to the collection system) was evaluated by isolating flow with wellhead valving to a sample port and recording the duration of time required to fill a 5-gallon bucket. Several tests were completed and the nearest whole number was used for the flow rate calculation.

To collect flow meter readings from the Geronimo sumps or wells all other systems were turned off and the Geronimo sump specified was operated by itself. These flow readings were collected from the flow meter that is on piping that collects flow from the entire system.

A flow meter reading was recorded at each system as appropriate. During the Hunt Well B reading the instantaneous flow reading at the meter declined rapidly during the short manual flow test, then recovered to the recorded number in Table 1 (10.5 gpm). The flow meter reading was based on the instantaneous flow reading setting (in gpm) from the display at each flow meter. The depth measurements provided (Table 1) are water level as measured in feet below top-of-vault or casing, as appropriate. Operational measurements collected from each seepage intercept system during the site visit are summarized in Table 1 for systems at the FAP. Attachment A presents a photograph log that shows the general condition of the inspected equipment.

Table 1: Geronimo and Hunt Intercept System Operations Measurements

Well/ Sump Name	Dead Head	Sole System Operation		Whole System Operation		Total Sump/ Well Depth	Bucket Test Flow Rate	Flow Meter Reading[1]
	psi	psi	DTW ft	psi	DTW ft	ft	gpm	gpm
GSX-3 / C	112	90 88	8.1 9.0	94 89	>8.75 w/ GSX-4 on	11.3	30	18
GSX-4 / D	98	78	<9.55	92	<9.55 w/ GSX-3 on	not measured	30	14.5
HSX-1[2] /A	NA	NA	NA	NA	NA	NA	NA	NA
HSX-2[3] / B	82	22	NA	NA	NA	not measured	13	10.5

1. Flow meter reading corresponds to isolated operate of the noted well/sump
2. Water level was clearly below the level of the pump intake, so could not test.
3. Flow meter reading was recorded from at the Hunt-only meter.

NA not applicable
psi pounds per square inch
DTW distance to water, as measured from sump top

The operation function testing at Geronimo C/GSX-3 revealed that the pump was able to turn on in AUTO initially; however, the pump control probes did not appear to be functioning when a test was performed with both probes immersed in a filled bucket. After observing the pump did not turn on at a later point when visually, the water level should have triggered the auto function, the probes were removed from the sump and fully immersed in the bucket to verify operation. The probes in this condition did not turn the pump on when the control panel HOA switch was set to AUTO. These probes are located approximately at 8.2 ft (ON probe) and 9.3 ft (OFF probe) below top of vault cover. It appears that the OFF level probe could be set lower, but the wiring was tangled in such a way that it is located at 1.1 ft below ON level probe. The wiring was untangled when reinstalling the probes in the well, but the OFF level probe cord was taped to the ON level cord to match the original levels.

4.0 RECOMMENDATIONS

Based on the results of the inspection documented herein, the following system changes are recommended:

- The design of the seepage intercept systems limits assessment of the individual system operations. Ideally, each seepage intercept system should be configured with a water level monitoring port/sounding tube (as applicable) on sumps and extraction wells, an elapsed time meter on the pump(s), a flow meter on the discharge piping for each pump, a pressure indicator, a sample port, and the ability to direct flow to a discharge location for testing.

- The Hunt sump water levels are below the pump intake and Plant staff indicate that there has been no water in this sump for quite a long time. It is recommended that the Hunt drainage trench operations be reviewed to assess if the cause of the lack of water from the drainage trench is clogging of the system. A rebuild of the drainage trench may be necessary to make it function as originally intended.

Re: **OPERATIONS INSPECTION OF THE BOTTOM ASH POND SEEPAGE INTERCEPT SYSTEMS**
Arizona Public Service Company Cholla Power Plant – Joseph City, AZ

1.0 INTRODUCTION

This Technical Memorandum documents the information gathered prior to and during inspections of seepage intercept system operations at the Bottom Ash Pond (BAP), located at the Arizona Public Service Company (APS) Cholla Power Plant in Navajo County, Arizona. The primary objective of this effort was to understand the configuration and operational capacity of the existing network of seepage intercept systems in order to evaluate whether the existing systems could be incorporated into a future remedy for corrective action at the BAP.

The following sections present a summary of available background information for the systems involved in seepage collection, documentation of data inspection findings, and recommendations for next steps.

2.0 BACKGROUND

There are four seepage intercept systems associated with the BAP (Figure 1): the Toe Drain Area sump and drainage trench, Tanner Wash Seep sump and drainage trench, Petroglyph Seep sump and drainage trench, and the TWX Area extraction wells (TWX-3 to 5, TWX-6R, 7R, 8R and TWX-9 to 10), also known as B-226 seep area or B-226 Seepage Intercept System. This section summarizes Wood's understanding of each system based on APS design drawings included as Attachment A, and well registration records archived with the Arizona Department of Water Resources (ADWR) Wells 55 Registry (Attachment B) and direct observations. The APS record drawings include subsurface components of these systems that Wood was unable to verify, and are described below based on those existing system record drawings. The Toe Drain Area intercept system discharges into the BAP with its own discharge piping. TWX Area, Tanner Wash Seep and Petroglyph Seep intercept systems are all connected to the same piping that discharges into the BAP.

2.1 Toe Drain Area Intercept System

The Toe Drain Seep Intercept System was constructed in the late 1970s and is located on the western edge of the BAP dam. It consists of an approximately 6-feet (ft) wide by 8-ft deep intercept trench connected to a collection sump. The intercept trench follows the natural grade and includes a 4-ft diameter perforated

Tel (602) 733-6000
Fax (602) 733-6100
www.woodplc.com

and asphalt-coated corrugated metal pipe (CMP), which is surrounded by drainage rock. Filter cloth envelops the drainage rock on all sides. The upper portion of the trench (above the filter cloth) is filled with approximately 2 ft of pit run gravel. The sump is 9 ft in diameter and built to a total depth of 25 ft below ground surface (bgs) and is made from asphalt-coated CMP. The bottom 1 ft of the sump has concrete fill. Two submersible pumps are installed in the sump operating in parallel, and they pump the water using level control logic through check valves, manual butterfly valves, and a combined flow totalizer up the north face of the dam to discharge into the BAP. There is also a drain line with a solenoid valve located between the two pump lines. The discharge piping downstream of the flow totalizer is constructed of 4-inch (in) diameter polyvinyl chloride (PVC) pipe that transitions to 4-in diameter steel pipe on the dam. Note that the available plans (Attachment A) show that this pipe is carbon steel; however, a field inspection shows that it transitions to PVC approximately 2-3 feet after the flow meter. The discharge piping drains water remaining in the pipe that does not discharge into the BAP back into the sump after the pumps shut off to provide freeze protection for the piping.

2.2 Tanner Wash Seep and Petroglyph Seep Intercept System

The Tanner Wash Seep and Petroglyph Seep intercept systems were constructed in the early 1990s and are located along the eastern edge of the BAP dam, each consisting of a drainage trench (i.e., French drain) connected to a collection sump (Figure 1). The drainage trenches are constructed of non-woven geotextile wrapped around drainage rock and contain a 4-in perforated high-density polyethylene (HDPE) pipe running along the bottom of the trench, which diverts the captured seepage water to the collection sumps. Each trench is covered with 6 in of native soil with a depth ranging from 4 to 6 ft. The length of the Tanner Wash Seep drainage trench is approximately 400 ft at a 1% slope gradient, and the invert depth of drainage pipe at the collection sump is at 6 ft bgs. The length of the Petroglyph Seep drainage trench is approximately 300 ft at a 1% slope and the approximate invert depth of the drainage pipe at the sump is 5.5 ft bgs.

The Tanner Wash Seep and Petroglyph Seep collection sumps are each constructed of a 4-ft diameter galvanized CMP; the bottom 4 ft of the CMP at each sump is perforated and the base of the sump is comprised of 6 in of concrete fill. The total depth of the Tanner Wash Sump is 10.5 ft and the Petroglyph Sump is 10 ft deep. The sumps contain a submersible pump or pumps that are set to operate when the water level in the sump reaches 4 ft above the base of the sump and shut off when the water level in the sump reaches 3 ft above the base of the sump.

Two submersible pumps plumbed in parallel and a single pump (Grundfos Model No. 25S10-7) are installed in the Tanner Wash and Petroglyph sumps, respectively. The pumps are connected to 1.5-in stainless steel discharge piping that transitions to carbon steel piping at the surface. Surface completions include a check valve and a manual gate valve for flow control. Discharge piping downstream of the surface completions transitions below grade to 2-in Drisco HDPE piping that is routed through a flow metering enclosure and then combines with other collection system flows. Downstream of the confluence with the Tanner Wash, TWX, and Petroglyph systems, the 2-in below-grade discharge piping transitions to 3-in Drisco HDPE pipe near the Petroglyph sump. The 3-in Drisco pipe then directs water along the southern edge of the BAP dam to an above-grade 3-in carbon steel pipe covered in insulation, which runs north up the face of the dam and discharges into the BAP.

2.3 TWX Area Extraction Wells

The TWX Area extraction wells and associated seepage collection system were installed in the early 1990s and are located along the eastern BAP dam north of the Tanner Wash seep. This area contains 8 dewatering wells designated TWX-3 to 5, TWX-6R, 7R, 8R and TWX-9 to 10 (Figure 1). Each extraction well pump has a dedicated pump control panel, labeled from A through H, corresponding to TWX wells labeled 3-10 (Figure 1), although the replacement wells are not labeled with the R designator. The ADWR well registry files for these wells (included as Attachment B and summarized in Table 1, attached) indicate that originally 13 borings were drilled, but 3 did not have extraction wells installed at those borings. The locations were initially identified as TWX-1 through TWX-13 for the borings with extraction wells installed in TWX-3 through 5, and TWX-9 and TWX-10. Borings TWX-6, TWX-7, and TWX-8 were drilled to depths ranging from 12 to 21 ft into competent bedrock before being abandoned; the reason the borings were abandoned is unknown. However, replacement wells were installed (TWX-6R, TWX-7R, and TWX-8R) near those locations. With the exception of TWX-10, the extraction wells were installed to 40 ft bgs and screened from 20 to 40 ft bgs. TSX-10 was installed to 35 ft bgs and screened from 20 to 35 ft bgs.

The extraction wells are equipped with submersible pumps (Grundfos Model No. 5S03-9) that discharge to 1-in stainless steel discharge piping inside the wells and transition to 1-in carbon steel piping at the surface. Surface completions include a check valve and a manual gate valve for flow control. Discharge piping downstream of the surface completions transitions below grade to 2-in Drisco HDPE piping that is routed to a common header and a system flow metering enclosure downstream of TWX-3. Discharge piping from the TWX area system then runs southwest along the road before connecting to the 3-in Drisco pipe near the Petroglyph sump, which leads to the 3-in PVC pipe discharging to the BAP. The drawings also show a 78-ft modified drainage trench near TWX-3 and indicate that TWX-3 receives water from the drainage trench through a hole in the well casing at approximately 4 ft bgs.

3.0 INSPECTION SUMMARY

On December 2 and 3, 2019, Wood conducted a site visit to inspect each seepage intercept system site. Pressure transducers were deployed in the Petroglyph sump, the Toe Drain sump, and piezometer B-228. A description of the inspection findings at each seepage collection system is provided below. Figures 2 through 6 depict the collected transducer data. Attachment C presents a photograph log that shows the general condition of the inspected equipment. A second inspection visit was conducted on June 23-25, 2021 to test the pump and controls operation at each site. A summary of the results from this visit is compiled in Table 2 and Table 3.

Table 2: BAP Operations Measurements, June 2021

Location	Well/Sump Name	Dead Head (psi)	Operating by self (psi)	Sump Water Depth (BTT[3])	Flow Meter Reading (gpm)
Toe Drain[1]	Pump A	NA	17 @ 5 min 34 @ 10 min	4.3 to 4.6 @ 10 mins pumping	10-15 instantaneous 30.5 @ 100-gal test[5]
	Pump B	NA[2]	34 @ 5 min 34 @ 10 min	NA	10-15 instantaneous 20.8 @ 100-gal test[5]
Tanner Wash	Pump A	NA	NA	NA	15.3
	Pump B	NA	NA	NA	15.2
Petroglyph	Petroglyph	98	78	6.27/7.45[4]	19.7

1. Flow rate with both pumps operating is 68 gpm as based on 100-gal test (see note 5).
2. 3-inch discharge valves inoperable.
3. Below top of tank (BTT) is measured as feet below the lid of the sump tank.
4. Water depth reading before testing/after testing.
5. Flow rate determined by time taken to reach 100 gallons as measured by the flow meter totalizer.

psi pounds per square inch
gpm gallons per minute
min minute
NA not applicable

3.1 Toe Drain Sump

The Toe Drain sump is equipped with two pumps and one control box. The controls are in one large control panel. These pumps have an alternating selector switch, which activates each time there is a "pump down cycle" and switches the lead and lag pumps to ensure the pumps alternate to balance run times. As noted previously, once the pumps shut off, the water remaining in the discharge piping drains back into the sump via a solenoid valve operation.

Figure 4 depicts water level data collected from the Toe Drain Sump from December 3, 2019 to January 8, 2020. The water level data indicate the Toe Drain Sump pumps were operational during this time frame. Typically, the lead pump starts when the sump water level reaches 5.8 ft bgs and shuts off when the sump water level reaches 8.2 ft bgs, though on certain occasions the pump did not turn on until the sump water level reached depths between 3.5 and 5 ft bgs. Figure 5 depicts a detailed view of the Toe Drain Sump water levels collected on January 4, 2020. When a pump is not operating, the sump water level rises approximately 2.12 ft in 375 minutes (6.25 hours). A sump diameter of 9 ft equates to an approximate average flow rate for seepage water entering the Toe Drain Sump of 2.7 gpm (i.e., the water-level data indicate that the intercept trench connected to the Toe Drain Sump captured approximately 2.7 gpm during the time of measurements). However, due to the drain back from the BAP discharge pipe for freeze protection, the accuracy of this value is uncertain. The flow meter was observed to turn backwards when the drain back occurred at the end of the pump cycle, which makes the totalizer function on the meter challenging to interpret. This piping and/or meter location could be modified to bypass the flow meter on the return flow for the drain operation.

During the June 2021 inspection, when the Auto Start initiated for Pump A, the water level dropped 4 in after ten minutes. A dead head pressure could not be obtained due to an inoperable gate valve on both pumps' discharge lines. The pressure at startup was 0 psi while the discharge line up to the BAP was filling with water prior to discharging into the BAP, and then slowly increased to 34 psig after 10 minutes.

During the testing of pump operations after the pumps had shut off, the volume of water that drained back from the discharge line increased the water level enough to start Pump B in Auto. The "Lag" pump only runs if a high water level probe is reached while the "Lead" pump is operating. It appears that one or both of the check valves in the common discharge piping are not fully functional as turbulence was observed in the sump during pump operation. There was an increase in sump water level during constant operation of Pump B. The rise in sump water level was only observed during Pump B solo operation, which may indicate that the check valve on Pump A is not working properly and is allowing water to recycle back into the sump.

3.2 Tanner Wash Sump

The Tanner Wash sump contains two submersible pumps that are plumbed to a single manifold and equipped with a flow meter. The flow meter is an inline impeller flow meter (Omni Sensus) installed in a separate dry vault within the fenced enclosure. Previously, there was an older Omega style flow meter installed with an indicator located near the top of the meter vault; however, the meter has been removed, leaving the indicator abandoned in place. The control panel has two control boxes, one for each pump. The pumps were set to the auto run position and were in working order during both of Wood's inspection. An unlabeled enclosure located between the pump control panels houses the MultiRanger 200 ultrasonic level control readout/controller. The pumps are controlled by this device to turn on and off based on levels measured by the ultrasonic device. The ultrasonic device is installed underneath the lid in the sump.

During the June 2021 visit, Pump "A" was able to run at 15.3 gallons per minute (gpm) and pump "B" was able to run at 15.2 gpm (Table 2), as measured by the flow meter. Each pump ran on its own; however, it is unknown if other systems sharing the discharge piping, such as those in the TWX area, were running at the same time that this test was conducted. The initial water level was 93 in below top of sump prior to operating any of the pumps. The sample port used 2-in fittings and Wood did not have the ability to connect to them either with a pressure gauge or hose and fittings. Therefore, Wood was unable to measure the pressure at this location nor perform a bucket test for flow measurement during the visit.

3.3 Petroglyph Sump

The Petroglyph Sump contains a submersible pump with Warrick level controls. The pump was operational during Wood's inspections. Figure 2 depicts water level data collected from the Petroglyph Sump from December 3, 2019 to January 8, 2020. The water level data indicate the Petroglyph Sump submersible pump was operational during this time frame. The pump starts when the sump water level reaches 8.4 ft bgs and shuts off when the sump water level reaches 9 ft bgs, This cycle takes approximately 10 minutes. Figure 3 depicts a detailed view of the Petroglyph Sump water levels collected on January 4, 2020. When the pump shuts off, the sump water level rises from 9 to 8.4 ft bgs in approximately 25 minutes. A sump diameter of 4 ft equates to an approximate average flow rate for seepage water entering the Petroglyph Sump of 2.3 gpm (i.e., the water-level data indicate that the intercept trench connected to the Petroglyph Sump captured an average of 2.3 gpm on that day).

The water level in the sump was at a level of 6.27 ft below the top of sump at the beginning of the inspection on June 25, 2021. A measurement of the height of the top of sump above the ground surface was not taken, thus comparison with the pump start/stops is not possible for the June 2021 data. With the pump in auto, the flow rate was 19.7 gpm as measured at the flow meter in instantaneous read mode. The dead head pressure was 98 psi at this site and the operating pressure was 78 psi. The water level in the sump after completion of the testing was 7.75 ft below the top of sump. It is unknown if any other systems were operating while this test was running.

3.4 TWX Area

The TWX Area consists of eight extraction wells inside a fenced compound (TWX-3 to 5, TWX-6R, 7R, 8R and TWX-9 to 10). During the June 2021 inspection, each pump was set to automatic operation, and with the exception of the pump for TWX-4, all pumps were working properly. The pump at TWX-4 did not run in auto, despite being set to off for 4 hours (assuming water levels rose sufficiently to reach the pump on setpoint during this time, as there is no way to observe the water level in the well); it also did not turn on when set to manual jog setting. The motor was able to be started at both Well TWX-7R and Well TWX-9, and flow could be observed at the sample ports; however, no flow was measured at the flow meter when operating either of those wells. See notes in Table 3 for all wells.

The water level data collected from the B-228 piezometer are depicted as Figure 6. This piezometer is located downgradient of the TWX extraction wells at a distance of approximately 20 ft from TWX-3 and is screened from 20 to 40 ft bgs. It would be expected that water levels in this piezometer would be indicative of the TWX Area system groundwater level trends. A noticeable increase in water levels occurred in this piezometer from December 13 to December 27, 2019. The sudden increase and decline may be related to the operational schedule of one or more of the TWX Area extraction wells.

The following table lists the flow rates and/or notes for each well as recorded on June 25, 2021.

Table 3: TWX Flow Measurements

Well	Pump Panel Label	Approx. Instantaneous Flow Rate (gpm)	Notes
TWX-03	A	22	NA
TWX-04	B	NA	Did not run in AUTO after being off for 4 hrs. Did not respond to manual JOG either. Further investigation indicated.
TWX-05	C	23	NA
TWX-06R	D	19	NA
TWX-07R	E	NA	The pump started but stopped by the time meter vault was reached for observation. On second attempt it stopped in 52 seconds. This indicates that the level control probes are likely too close together, resulting in frequent and short start/stop runs. This should be addressed, or pump will fail much sooner than desired. Verified pump was running and observed flow at sample port. Closed sample port and throttled discharge in an attempt to get the flow to

Well	Pump Panel Label	Approx. Instantaneous Flow Rate (gpm)	Notes
			the meter, but no flow was observed at the meter during operation of this pump. Further investigation required.
TWX-08R	F	18	NA
TWX-09	G	NA	No flow at meter, water was present at sample port.
TWX-10	H	NA	Pump did not start in AUTO and could not observe flow rate due to the presence of AUTO/JOG 2-position selector switches.

gpm gallons per minute
NA not applicable

4.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the inspections documented herein:

- The configuration of the seepage intercept systems limits assessment of the operations. Ideally, each seepage intercept system should be configured with a water level monitoring port/sounding tube (as applicable) on sumps and extraction wells (some installations do have a functioning port), an elapsed time meter on the pump(s), a flow meter on the discharge piping for each pump, a pressure indicator, a sample port, and the ability to direct flow to a discharge location for testing.
- TWX Area – TWX-4 pump should be pulled from the extraction well for inspection, as it does not seem to be in working order. The control panel for this well could also be the source of the issue and thus should be inspected for electrical problems. Further inspections and testing should be performed on the other pumps and control panels for pumps that either did not start in auto or where the flow meter did not register flow when operating.
- During the June 2021 investigation in the TWX Area there was only one person conducting the testing. Testing with one person is difficult due to the pump controls running with a JOG switch, which makes it very difficult or impossible to measure flows at each well head. It is recommended that further testing be conducted with at least 2 people able to operate the controls and measure individual flows to evaluate flows using the JOG switches at each well/pump.
- Once information regarding individual pump information can be monitored, pump data collected from the systems should be compiled and reviewed regularly to ascertain when the systems last extracted groundwater and if the pumps are functioning properly.
- The piping and meter at the Toe Drain should be modified so that the meter does not turn backwards during drain back of the discharge piping. It is recommended that bypass piping be installed at the flow meter to allow the drainback to bypass the meter. New check valves and isolation valves could be installed to allow the flow to bypass the meter on drainback but still measure flow when pumps are operating.

NOTES:

1) ALL ELEVATIONS REFERENCED NAVD 1988 UNLESS OTHERWISE NOTED.

2) CONTOURS SHOWN ARE 2' CONTOURS

3) MAIN RESERVOIR WATER LEVEL AS MEASURED BY SURVEYOR ON 9/4/09 WL=5113.3 (USING GPS, AND DATUM NAVD 88) WL=5111.2 (USING DWLG, NGVD 29, PRE EXISTING DATUM USED WHEN DAM WAS CONSTRUCTED)

4) WEST DECANT CELL WATER LEVEL AS MEASURED BY SURVEYOR ON 9/4/09 WL=5125.37 (GPS NAVD 88)

5) DECANTED SOLIDS CURRENTLY BEING EXCAVATED FROM EAST DECANT CELL

6) MAIN RESERVOIR MAXIMUM OPERATING WATER LEVEL 5117.8 (REF ADWR DAM PERMIT #09.27) NGVD 29

7) MAIN RESERVOIR TOP OF DAM ELEVATION 5123.3 (REF DWG G-44556 AND ADWR DAM PERMIT #09.27) NGVD 29

8) MAIN RESERVOIR ESTIMATED VOLUME CAPACITY IS 115 ACRE FEET BETWEEN CURRENT WATER LEVEL AND MAXIMUM OPERATING WATER LEVEL.

9) WEST DECANT CELL CONTAINS APPROXIMATELY 3.7 ACRE FEET OF WATER.

10) SUMMARY: MAIN RESERVOIR HAS AMPLE VOLUME CAPACITY IN THE EVENT THE WEST CELL EMBANKMENT IS BREACHED.

GENERAL INSTRUCTIONS

1. Fill out this form in DUPLICATE and send WITH $10.00 FEE to 15 South 15th Avenue, Phoenix AZ 85007.
2. For specific instructions, limitations and conditions, see the reverse side of this form.
3. This form is to be used to drill, deepen, replace or modify a well outside of an Active Management Area.
4. If the well is a replacement, deepening or modification of an existing well, provide the registration number of the existing well in Item 8.
5. Construction standards for wells, including abandonment, shall be in accordance with Department rules.
6. Section §45-596(D), provides that the Director shall determine that all information required on form has been submitted. If not, the person filing will be notified, and the drilling, deepening, or modification of the well may not proceed.

GENERAL INSTRUCTIONS

1. Fill out this form in DUPLICATE and send WITH $10.00 FEE to 15 South 15th Avenue, Phoenix, AZ 85007.
2. For specific instructions, limitations and conditions, see the reverse side of this form.
3. This form is to be used to drill, deepen, replace or modify a well outside of an Active Management Area.
4. If the well is a replacement, deepening or modification of an existing well, provide the registration number of the existing well in Item 8.
5. Construction standards for wells, including abandonment, shall be in accordance with Department Rules.
6. Section §45-596(D), provides that the Director shall determine that all information required on form has been submitted. If not, the person filing will be notified, and the drilling, deepening, or modification of the well may not proceed.

VARIANCE GRANTED

I state that this Notice is filed in compliance with A.R.S. §45-596 and is complete and correct to the best of my knowledge and belief and that I understand the limitations under which I must operate this well as set forth on the reverse side of this form.

WELL ABANDONMENT COMPLETION REPORT

A.R.S. §45-594; R12-15-816: Within 30 days after a well is abandoned, the well drilling contractor shall file a well Abandonment Completion Report on a form prescribed and furnished by the Director.

1. Well Registration No. 55- 539101

2. Well Location: 18 (N)/S Township 19 (E)/W Range 13 Section SE 1/4 10 Acre SW 1/4 40 Acre SW 1/4 160 Acre

3. Owner of the Land:
Name: APS
PO BOX 188 Address Joseph City City, AZ State 86032 Zip

4. Well Description: 12' Hole Depth 12" Diameter ____ Type of Casing

5. Reason for abandonment: Shallow Rock, During drilling

6. Prior to abandoment, did the well have 20' of steel surface casing AND 20' of grout in the annular space surrounding the surface casing? Yes____ No X

7. If the answer to No. 6 is no, was the top 20' of casing removed prior to setting the cement plug? Yes____ No ✓

8. Identify the materials and methods used to abandon the well: No well was installed. Back fill with Grout

9. Is this Abandonment Completion Report filed in accordance with R12-15-816,F.?: Yes ✓ No____

10. How deep does the cement plug extend below land surface? 12'

11. Was the well backfilled above the cement plug? Yes____ No N/A

12. Date abandonment completed: 7-9-93

APR 6 1994

Dear Well Owner:

The Department of Water Resources issued drilling authority one year ago for the well referenced by the file and registration number as indicated on the above label. To date, our records show that this well has not been drilled.

The registered well owner must submit a **Completion Report** which specifies the data relating to the pump equipment, with thirty (30) days of installation. There is no time limit by which you must install any pump equipment, but the **Completion Report** (form enclosed) must be submitted within thirty (30) days of installation.

If your well has been drilled, your file needs the above mentioned report to bring the well into compliance with the law, and you should ensure that this is done.

If you have not drilled your well, but is is your intention to do so in the future, this is to advise you that you must refile a **Notice of Intent to Drill** in order to obtain authority to commence drilling.

The Department's file numbering system is explained in detail on the reverse side of this letter.

Your immediate assistance is appreciated. If you have any questions, or need further information, please contact Carlane Stephan at (602) 542-1581.

Sincerely,

Bruce S. D.

Bruce S. Davis

GENERAL INSTRUCTIONS

1. Fill out this form in DUPLICATE and send WITH $10.00 FEE to 15 South 15th Avenue, Phoenix, AZ 85007.
2. For specific instructions, limitations and conditions, see the reverse side of this form.
3. This form is to be used to drill, deepen, replace or modify a well outside of an Active Management Area.
4. If the well is a replacement, depening or modification of an existing well, provide the registation number of the existing well in Item 8.
5. Construction standards for wells, including abandonment, shall be in accordance with Department Rules.
6. Section §45-596(D), providesthat the Director shall determine that all information required on form has been submitted. If not, the person filing will be notified, and the drilling, deepening, or modification of the well may not proceed.

MICROFILMED

I state that this Notice is filed in compliance with A.R.S. §45-596 and is complete and correct to the best of my knowledge and belief and that I understand the limitations under which I must operate this well as set forth on the reverse side of this form.

Evaluation of Reduction/Oxidation Conditions in Groundwater at the Bottom Ash Pond

Technical Memorandum

To:	Arizona Public Service Company	**Project No:** 14-2018-2040	
By:	Maren Henley, PE	**Reviewed by:** Bruce Wielinga

Date:	May 27, 2021		

Re: **EVALUATION OF REDUCTION/OXIDATION CONDITIONS IN GROUNDWATER AT THE BOTTOM ASH POND**
Arizona Public Service Cholla Power Plant – Navajo County, Arizona

1.0 INTRODUCTION

This technical memorandum (Tech Memo) documents an evaluation of the reduction/oxidation (redox) processes in groundwater downgradient of the Bottom Ash Pond (BAP), located at the Arizona Public Service Company (APS) Cholla Power Plant in Navajo County, Arizona (the Site). This evaluation was prepared pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections (§) 257.90 through 257.98 (Federal Register, 2020).

Site background, CCR groundwater monitoring system, and historical operational information are presented in the *Annual Groundwater Monitoring and Corrective Action Report for 2020* (Wood Environment & Infrastructure Solutions, Inc. [Wood], 2021). The subject of this investigation is the BAP, a CCR unit which primarily receives bottom ash slurry from the plant (Figure 1). The BAP impounds bottom ash slurry using a dam system comprised of an eastern and southern dam. The eastern dam is constructed on the Chinle geologic unit, and Holbrook and Moqui members of the Moenkopi geologic unit, while the southern dam is constructed on the Tanner Wash Alluvium and Moqui geologic unit. The southern BAP dam has a clay core which extends through alluvium to bedrock where the alluvium was less than 20 feet (ft) thick at the time of construction. In areas where the alluvium was greater than 20 ft thick, a slurry cutoff wall was constructed that generally extended to bedrock. Due to the depths involved, the cutoff wall does not extend to bedrock in the middle of the channel underlying the southern dam. There is an approximately 10 to 20-ft thick layer of alluvium below the base of the cutoff wall (at an elevation of 4,980 ft above mean sea level) in this area. Groundwater near the BAP generally flows south-southwest through the Tanner Wash Alluvium to its confluence with the Little Colorado River Alluvium.

2.0 BASIS FOR INVESTIGATION

This evaluation was conducted to evaluate the relationship between cobalt concentrations and redox conditions in groundwater downgradient of the BAP. Cobalt, a constituent regulated under the CCR Rule's Appendix IV list, is present in groundwater downgradient of the BAP at concentrations exceeding the groundwater protection standard (GWPS) for cobalt of 0.006 milligrams per liter (mg/L). Based on the results of routine groundwater sampling conducted since the GWPS exceedance was declared for cobalt in October

4600 East Washington Street, Suite 600
Phoenix, Arizona 85034
Tel (602) 733-6000
Fax (602) 733-6100
www.woodplc.com

2018, detected cobalt concentrations at compliance and supplementary monitoring wells downgradient of the BAP have ranged from 0.00079 mg/L at W-308 in February 2019 to 0.084 mg/L at W-307 in April 2020. Figure 1 depicts cobalt concentrations in groundwater based on groundwater sampling events conducted in April and October 2020, which are comparable to concentrations observed in prior sampling events.

Previous investigations suggest the elevated cobalt concentrations are not directly attributable to water in the BAP (Wood, 2020) because cobalt concentrations detected in BAP water samples are less than concentrations routinely detected in groundwater. Available BAP water analysis data indicate cobalt concentrations range from 0.00099 to 0.0012 mg/L. A potential cause may be the mobilization of cobalt from solid materials underlying the BAP (e.g., bottom ash, alluvium, or the Moqui) as a result of reducing conditions in groundwater (Wood, 2020). To further evaluate this possibility, groundwater samples collected from BAP monitoring wells in April and October 2020 were analyzed for several constituents which are useful in assessing the redox conditions in groundwater. These constituents include:

- Dissolved and total concentrations of iron, manganese, arsenic, and cobalt;
- Nitrate, ammonia, total organic carbon (TOC), dissolved organic carbon (DOC); and
- Ferrous iron (Fe^{2+}) and nitrite (NO_2^-) using field speciation sampling kits.

These constituents can indicate the nature of redox conditions and the speciation of trace metals relevant to cobalt mobilization. TOC and DOC can contribute to the development of reducing conditions. Ammonia and nitrate are good indicators of redox conditions due to the nitrate (NO_3^-; the most oxidized N species) and ammonia (NH_3, a reduced N species) redox couple. Under aerobic conditions, ammonia can be rapidly oxidized to nitrate due to the activity of ammonia-oxidizing bacteria. Thus, the presence of ammonia combined with absence of nitrate can also indicate reducing conditions. Field measurements of dissolved oxygen (DO), oxidation-reduction potential (ORP), and pH were also collected to further assess the groundwater redox conditions.

3.0 DESCRIPTION OF INVESTIGATION ACTIVITIES

The monitoring wells selected for redox analyses are depicted on Figure 1. Groundwater samples were collected using dedicated low-flow sampling pumps and analyzed according to the sampling and analysis plan developed for the Site (Montgomery & Associates, 2015). Samples collected for dissolved inorganic compound analysis were field filtered using a single use 0.45-micron filter and immediately preserved with nitric acid. Each sample was labeled and placed on ice for transport to TestAmerica Laboratories, Inc., an Arizona Department of Health-certified laboratory (AZ0728) for analysis. Field speciation analyses for Fe^{2+} and NO_2^- were performed using a Hach® DR 900 colorimeter, and field measurements of DO, ORP, and pH were collected using a field-calibrated YSI multiparameter meter and in-line flow through cell connected to the pump discharge tubing.

4.0 SAMPLING RESULTS AND ANALYSIS

This section provides a summary of the results of the investigation and a discussion of their relevance. Attachment A presents the laboratory analytical report for the collected samples, while Table 1 summarizes the laboratory results and field measurements. Figure 1 depicts concentrations of select constituents measured in the groundwater samples collected from the subject wells.

4.1 Results and Discussion

Cobalt is a redox sensitive metal with two oxidations states in the environment, +2 and +3, with Co^{2+} being the dominant form in soil solution. Cobalt as Co^{2+} associates preferentially with oxides of iron and manganese due to chemisorption and co-precipitation (McBride, 1994). Cobalt and manganese are closely associated in many soils because they have similar chemical properties. In addition, there is evidence that on Mn oxides, Co^{2+} is oxidized and strongly bound as Co^{3+} or precipitated as $CoOOH_{(s)}$ (Alloway, 2013). Thus, under reducing condition the concomitant reduction of Fe and Mn oxides and Co(III) substantially increases the solubility of all three metals.

Concentrations of dissolved inorganics were comparable to respective total (unfiltered) concentrations, indicating arsenic, cobalt, iron, and manganese are present in groundwater downgradient of the BAP predominately as dissolved constituents. The exception is the April 19, 2020 sample collected from M-52A, where total iron was detected at 5.0 mg/L and dissolved iron was detected at 2.9 mg/L. These were the highest iron concentrations detected at any of the BAP wells, and the subsequent sample collected from M-52A in October 2020 indicated total and dissolved iron concentrations of 0.41 and 0.21 mg/L, respectively. It is possible that the high iron concentrations detected in the April 2020 sample resulted from high water turbidity and the presence of colloidal iron in the samples as the turbidity in the April 2020 sample was 22.1 Nephelometric Turbidity Units, which was the highest result for any of the samples. APS site personnel have reported that historical turbidity concentrations at M-52A are typically higher than other monitoring wells at the BAP.

The pH of the groundwater samples ranged from 6.7 to 7.8 standard units, indicating the concentrations of dissolved inorganics in the groundwater samples are not the result of mineral phase dissolution by low pH groundwater. However, the presence of dissolved iron at neutral to slightly alkaline pH suggests the presence of ferrous iron (Fe^{2+}) as ferric iron (Fe^{3+}) under these pH conditions rapidly hydrolyzes with water to form sparingly soluble Fe (oxy)hydroxides. The presence of Fe^{2+} is indicative of the reductive dissolution of iron (oxy)hydroxide mineral phases and these conditions would also support the reductive dissolution of Mn oxides and conversion of Co^{3+} to Co^{2+}.

The next highest iron concentrations were detected in the October 2020 sample from MW-69A at 2.3 mg/L (total iron) and 1.1 mg/L (dissolved iron). Dissolved iron was observed above the analytical laboratory method detection limit (MDL) at five additional wells including W-302, W-304, W-305, W-306 and W-307. As discussed above, the pH of the groundwater is circumneutral to slightly alkaline and in this pH range under oxic conditions dissolved iron is generally expected to be very low, often below the MDL due to the rapid formation of sparingly soluble iron hydroxides. These results suggest redox conditions in groundwater at many locations downgradient of the BAP are slightly reducing. Ferrous iron was also measured at 14 of the 15 monitoring wells, also indicating the presence of iron reducing conditions. However, field measured ferrous iron was detected at several wells where both total and dissolved iron were below the RL, suggesting potential interferences resulting in false positive readings for the field measured ferrous iron and thus these results need to be interpreted with caution. However, part of the inconsistency is also likely related to the analytical detection limit of 0.1 mg/L for dissolved iron compared to the Hach® colorimetric method that lists the detectable range from 0 to 3.0 mg/L.

The highest total and dissolved manganese concentrations were detected in samples collected from M-53A, MW-69A, and W-305; concentrations at these wells ranged from 4.7 to 8.6 mg/L. Dissolved manganese was detected at all of the remaining wells in at least one sample except for at W-306 where it was below the RL for both sampling events.

The concentration of dissolved cobalt ranged from <0.0005 mg/L to 0.085 mg/L with a median of 0.021 mg/L. The highest concentrations of total and dissolved cobalt were detected at W-307 and M-52A. Cobalt was measured in all but two wells including M-55A and W-309 both of which are to the northeast of the BAP. All wells in which cobalt was detected also had measurable ferrous iron except MW-53A. However, MW-53A did have some of the highest concentrations of total and dissolved manganese. These data are consistent with the presence of cobalt associated with reducing groundwater conditions.

Total and dissolved arsenic was observed at concentrations above the RL at all wells except W-305. Total and dissolved arsenic concentrations were relatively low, ranging from 0.001 mg/L to 0.014 mg/L in the October 2020 sample collected from W-306. Median concentrations of arsenic were 0.0025 mg/L for both the total and dissolved phases. Arsenic is another groundwater constituent that is often mobilized because of the reductive dissolution of iron hydroxide minerals (Kocar et al., 2006).

Ammonia was detected in only one sample from M-52A at 0.54 mg/L and was not detected in the rest of the samples above the laboratory reporting limit of 0.50 mg/L. Nitrate was either not detected above laboratory reporting limits (0.25 and 0.50 mg/L) or was detected at concentrations below 1 mg/L, except for wells W-301 (17 and 20 mg/L), W-309 (2.6 and 3.2 mg/L), and W-317 (4.5 mg/L). These wells are located near Tanner Wash on the periphery of the BAP monitoring network. It is likely that the relatively high nitrate concentrations at these wells are the result of surface water impacts from ephemeral flow in Tanner Wash. At all locations where nitrate was detected, the concentration of iron was below the RL, consistent with the lower redox conditions indicated by the presence of dissolved iron as nitrate is expected to be reduced to dinitrogen gas (N_2) at an Eh higher than iron reduction.

TOC and DOC were measured at relatively comparable concentrations in all of the groundwater samples; TOC concentrations ranged from 0.64 to 3.2 mg/L, while DOC concentrations ranged from 0.97 to 3.4 mg/L. The highest TOC and DOC concentrations were detected in samples collected from M-55A.

4.2 Field Speciation Results

For the iron speciation sampling, the highest Fe^{2+} concentration was detected in the April 2020 sample from W-307 at >3.0 mg/L, which is the maximum concentration measurable with the Hach® ferrous iron method in a raw sample without dilution. As noted above, Fe^{2+} was measured at 14 of the 15 wells at concentration that ranged from 0.02 mg/L to >3.0 mg/L.

4.3 Field Parameters

Dissolved oxygen (DO) concentrations at the BAP wells ranged from 0.13 to 2.30 mg/L and collected oxidation-reduction potential (ORP) measurements ranged from -64.4 to 368.8 mV, with the only negative value being recorded at MW-69A in October 2020. Because the data quality of field parameters (in particular DO and ORP) are not subject to the rigorous quality assurance/quality control procedures used to evaluate laboratory analytical data, the reported measurements are considered a rough approximation of the groundwater redox conditions.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The results of this groundwater redox evaluation can be summarized as follows:

- Ferrous iron was observed at 14 of the 15 wells sampled.
- Dissolved manganese was also measured at all but one well (W-306).
- There was a fairly strong correlation between field measured Fe^{2+} and cobalt concentrations with an R^2 of 0.69.
- The presence of dissolved iron and ferrous iron at many of the wells adjacent to the BAP indicates the presence of reducing conditions in the groundwater. The redox is sufficiently low to result in the reductive dissolution of iron and manganese oxyhydroxides, which would tend to solubilize naturally occurring cobalt either adsorbed to or co-precipitated with those mineral phases present in the aquifer solids.
- Reducing conditions would also facilitate the reduction of cobalt hydroxide mineral phases with the subsequent mobilization of Co^{2+} to groundwater.

Further evaluation of groundwater redox conditions at the BAP is warranted. Therefore, Wood recommends three additional rounds of laboratory analysis for dissolved iron, dissolved manganese, dissolved cobalt and dissolved organic carbon with groundwater samples collected from M-52A, M-53A, M-55A, M-69A, M-70M, W-301 through W-309, and W-314.

In addition, analysis of solid phase material around the BAP would provide information on how cobalt is partitioned in the solid phase and what metals or mineral fractions it is most closely associated with.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Table of Contents

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
D5	Minimum Reporting Limit (MRL) adjusted due to sample dilution; analyte was non-detect in the sample.
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
R13	MS/MSD RPD exceeded the method acceptance limit. Matrix spike recovery was outside acceptance criteria. Batch precision and accuracy were demonstrated.

Metals

Qualifier	Qualifier Description
B3	Target analyte detected in calibration blank at or above the method reporting limit.
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
E4	Concentration estimated. Analyte was detected below laboratory minimum reporting level (MRL) but above MDL.
E8	Analyte reported to MDL per project specification. Target analyte was not detected in the sample.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.

General Chemistry

Qualifier	Qualifier Description
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
H5	This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
R8	Sample RPD exceeded the method acceptance limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 550-141150-1

Laboratory: Eurofins TestAmerica, Phoenix

Narrative

Job Narrative
550-141150-1

Comments
This report contains the 200.7 metals reported down to the MDL.

Receipt
The samples were received on 4/21/2020 2:51 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 1.7º C, 2.0º C, 3.2º C, 3.7º C and 4.8º C.

Receipt Exceptions
The following samples for metals were received unpreserved and were preserved upon receipt to the laboratory: CH-CCR-M52-0420 (550-141150-1), CH-CCR-M52-0420 (550-141150-1[MS]), CH-CCR-M52-0420 (550-141150-1[MSD]), CH-CCR-M52-0420 (550-141150-2), CH-CCR-M52-0420 (550-141150-2[MS]), CH-CCR-M52-0420 (550-141150-2[MSD]), CH-CCR-M53-0420 (550-141150-3), CH-CCR-M53-0420 (550-141150-4), CH-CCR-M55-0420 (550-141150-5), CH-CCR-M55-0420 (550-141150-6), CH-CCR-M69-0420 (550-141150-7), CH-CCR-M69-0420 (550-141150-8), CH-CCR-M70-0420 (550-141150-9), CH-CCR-M70-0420 (550-141150-10), CH-CCR-W301-0420 (550-141150-11), CH-CCR-W301-0420 (550-141150-12), CH-CCR-W302-0420 (550-141150-13), CH-CCR-W302-0420 (550-141150-14), CH-CCR-W303-0420 (550-141150-15), CH-CCR-W303-0420 (550-141150-16), CH-CCR-W304-0420 (550-141150-17), CH-CCR-W304-0420 (550-141150-18), CH-CCR-FD03-0420 (550-141150-19), CH-CCR-FD03-0420 (550-141150-20), CH-CCR-W305-0420 (550-141150-21), CH-CCR-W305-0420 (550-141150-22), CH-CCR-W306-0420 (550-141150-23), CH-CCR-W306-0420 (550-141150-24), CH-CCR-W307-0420 (550-141150-25), CH-CCR-W307-0420 (550-141150-26), CH-CCR-W308-0420 (550-141150-27), CH-CCR-W308-0420 (550-141150-28), CH-CCR-W314-0420 (550-141150-29), CH-CCR-W314-0420 (550-141150-30), CH-CCR-W317-0420 (550-141150-31), CH-CCR-FD04-0420 (550-141150-32) and CH-CCR-FD04-0420 (550-141150-33). Regulatory documents require a 24-hour waiting period from the time of the addition of the acid preservative to the time of digestion.

HPLC/IC
Method 300.0: The following samples were diluted for Fluoride by method EPA 300.0 due to the nature of the samples matrix: CH-CCR-M55-0420 (550-141150-5), CH-CCR-W301-0420 (550-141150-11), CH-CCR-W303-0420 (550-141150-15), CH-CCR-W304-0420 (550-141150-17), CH-CCR-W305-0420 (550-141150-21), CH-CCR-W307-0420 (550-141150-25), CH-CCR-W308-0420 (550-141150-27) and CH-CCR-W317-0420 (550-141150-31). The samples contained high concentrations of Chloride and Sulfate which exceeded the instrument's maximum column capacity. Fluoride was not detected in the diluted samples. As such, elevated reporting limits (RLs) have been provided and these data have been qualified with D1 and D5 flags.

Method 300.0: The matrix spike (MS) recovery and the matrix spike / matrix spike duplicate (MS/MSD) precision for analytical batch 550-209010 were outside control limits for Fluoride by method EPA 300.0. Sample matrix interference and/or non-homogeneity were suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) recoveries and precision were within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 200.7 Rev 4.4: The continuing calibration blank (CCB) for analytical batch 550-209337 contained sodium above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

Method 200.7 Rev 4.4: The following samples were diluted to bring the concentration of target analytes within the calibration range: CH-CCR-M52-0420 (550-141150-1), CH-CCR-M53-0420 (550-141150-3), CH-CCR-M55-0420 (550-141150-5), CH-CCR-M69-0420 (550-141150-7), CH-CCR-M70-0420 (550-141150-9), CH-CCR-W301-0420 (550-141150-11), CH-CCR-W302-0420 (550-141150-13), CH-CCR-W303-0420 (550-141150-15), CH-CCR-W304-0420 (550-141150-17), CH-CCR-FD03-0420 (550-141150-19), CH-CCR-W305-0420 (550-141150-21), CH-CCR-W306-0420 (550-141150-23), CH-CCR-W307-0420 (550-141150-25), CH-CCR-W308-0420 (550-141150-27), CH-CCR-W314-0420 (550-141150-29) and (550-141149-B-3-D ^10). Elevated reporting limits (RLs) are provided.

Method 200.7 Rev 4.4: The following samples were diluted to bring the concentration of target analytes within the calibration range:

Job ID: 550-141150-1 (Continued)

Laboratory: Eurofins TestAmerica, Phoenix (Continued)

CH-CCR-M55-0420 (550-141150-6) and CH-CCR-FD04-0420 (550-141150-32). Elevated reporting limits (RLs) are provided.

Method 200.7 Rev 4.4: The following samples were diluted due to the nature of the sample matrix (internal standard failures and undiluted caused instrument shut down): CH-CCR-M52-0420 (550-141150-1), CH-CCR-M53-0420 (550-141150-3), CH-CCR-M55-0420 (550-141150-5), CH-CCR-M69-0420 (550-141150-7), CH-CCR-M70-0420 (550-141150-9), CH-CCR-W301-0420 (550-141150-11), CH-CCR-W302-0420 (550-141150-13), CH-CCR-W303-0420 (550-141150-15), CH-CCR-W304-0420 (550-141150-17), CH-CCR-FD03-0420 (550-141150-19), CH-CCR-W305-0420 (550-141150-21), CH-CCR-W306-0420 (550-141150-23), CH-CCR-W307-0420 (550-141150-25), CH-CCR-W308-0420 (550-141150-27), CH-CCR-W314-0420 (550-141150-29), (550-141149-B-3-D ^5), (550-141149-B-3-B MS ^5) and (550-141149-B-3-C MSD ^5). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method SM 2320B: The sample duplicate (DU) precision for 550-208656 was outside control limits for Bicarbonate Alkalinity and Total Alkalinity associated with the following sample; CH-CCR-M52-0420 (550-141150-1) and (550-141150-C-1 DU). Sample matrix interference was suspected.

Method SM 5310B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for 550-208812 were outside control limits for Dissolved Organic Carbon (DOC). Sample matrix interference was suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) recoveries were within acceptance limits.

Method SM 5310B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for 550-209233 were outside control limits for Total Organic Carbon (TOC). Sample matrix interference was suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) recoveries were within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Arizona Public Service Company
Project/Site: CCR Groundwater Monitoring

Job ID: 550-141150-1
SDG: APS Cholla Power Plant (BAP)

Laboratory: Eurofins TestAmerica, Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Arizona	State	AZ0728	06-08-20

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
200.8 LL	200.8	Water	Molybdenum
SM 2320B		Water	Alkalinity, Phenolphthalein
SM 2540C		Water	Total Dissolved Solids
SM 4500 H+ B		Water	Temperature
SM 5310B		Water	Dissolved Organic Carbon - Quad

Method Summary

Method	Method Description	Protocol	Laboratory
300.0	Anions, Ion Chromatography	MCAWW	TAL PHX

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	False	Check done at department level as required.

Table of Contents

1 2 3 4 5 6 7 8 9 10 11 12 13 14

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
D5	Minimum Reporting Limit (MRL) adjusted due to sample dilution; analyte was non-detect in the sample.
E4	Concentration estimated. Analyte was detected below laboratory minimum reporting level (MRL) but above MDL.
E8	Analyte reported to MDL per project specification. Target analyte was not detected in the sample.
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.

Metals

Qualifier	Qualifier Description
B3	Target analyte detected in calibration blank at or above the method reporting limit.
D1	Sample required dilution due to matrix.
E4	Concentration estimated. Analyte was detected below laboratory minimum reporting level (MRL) but above MDL.
E8	Analyte reported to MDL per project specification. Target analyte was not detected in the sample.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.

General Chemistry

Qualifier	Qualifier Description
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
E4	Concentration estimated. Analyte was detected below laboratory minimum reporting level (MRL) but above MDL.
E8	Analyte reported to MDL per project specification. Target analyte was not detected in the sample.
H5	This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

Job Narrative
550-151758-1

Comments
Results reported to the MDL.

Receipt
The samples were received on 10/26/2020 2:25 PM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.3º C, 2.0º C and 3.5º C.

Receipt Exceptions
CH-CCR-M52-1020 (550-151758-1), CH-CCR-M53-1020 (550-151758-3), CH-CCR-M55-1020 (550-151758-5), CH-CCR-M69-1020 (550-151758-7), CH-CCR-M70-1020 (550-151758-9), CH-CCR-W301-1020 (550-151758-11), CH-CCR-W302-1020 (550-151758-13), CH-CCR-W303-1020 (550-151758-15), CH-CCR-W304-1020 (550-151758-17), CH-CCR-FD03-1020 (550-151758-19), CH-CCR-W305-1020 (550-151758-21), CH-CCR-W306-1020 (550-151758-23), CH-CCR-W307-1020 (550-151758-25), CH-CCR-W308-1020 (550-151758-27), CH-CCR-W309-1020 (550-151758-29), CH-CCR-W314-1020 (550-151758-31) and CH-CCR-FD04-1020 (550-151758-34)

Containers received with about 75mL in containers.

CH-CCR-W317-1020 (550-151758-33)

About 125 ml provided in container I

HPLC/IC
Method 300.0: The following samples were diluted for Fluoride due to the nature of the samples matrix: CH-CCR-M55-1020 (550-151758-5), CH-CCR-W301-1020 (550-151758-11), CH-CCR-W303-1020 (550-151758-15) and CH-CCR-W304-1020 (550-151758-17). This analyte was not detected in the diluted samples. Elevated reporting limits (RLs) have been provided.

Method 300.0: The following sample were diluted for Fluoride due to the nature of the sample matrix: CH-CCR-W305-1020 (550-151758-21), CH-CCR-W307-1020 (550-151758-25), CH-CCR-W308-1020 (550-151758-27), CH-CCR-W317-1020 (550-151758-33), CH-CCR-FD04-1020 (550-151758-34) and (550-151757-A-5 ^50). This analyte was not detected in the diluted samples. As such, elevated reporting limits (RLs) have been provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 200.8: insufficient sample volume
CH-CCR-M69-1020 (550-151758-7) and CH-CCR-W317-1020 (550-151758-33)

Method 200.8 LL: The continuing calibration blank (CCB) for analytical batch 550-225482 contained Selenium above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

Method 200.8 LL: The continuing calibration blank (CCB) for analytical batch 550-226262 contained Selenium above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

Method 200.7: A deviation from the Standard Operating Procedure (SOP) occurred. Details are as follows: Due to insufficient sample volume the samples were prepared at 25ml instead of the standard 50ml.

Method 200.7: A deviation from the Standard Operating Procedure (SOP) occurred. Details are as follows: Due to insufficient sample volume the samples were prepared at half volume.

Method 200.7: A deviation from the Standard Operating Procedure (SOP) occurred. Details are as follows: For method 200.7 we perform

1 2 3 4 5 6 7 8 9 10 11 12 13 14

Job ID: 550-151758-1 (Continued)

Laboratory: Eurofins TestAmerica, Phoenix (Continued)

an MS/MSD for every 10 prepared samples. Due to analyst error only 1 MS/MSD pair was performed for prep batch 516897. Due to limited remaining volume the samples were not re-prepared.

Method 200.7: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 280-517511. An LCS/LCSD was added to the prep.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Arizona Public Service Company | Job ID: 550-151758-1
Project/Site: CCR Groundwater Monitoring | SDG: APS Cholla Power Plant (BAP)

Laboratory: Eurofins TestAmerica, Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Arizona	State	AZ0728	06-08-21

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
200.8 LL	200.8	Water	Molybdenum
SM 4500 H+ B		Water	Temperature
SM 5310B		Water	Dissolved Organic Carbon - Quad

Laboratory: Eurofins TestAmerica, Denver

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☑ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☑ Disposal by Lab ☐ Archive for ______ Months

Special Instructions/QC Requirements & Comments:

*Perform Method 200.8 with collision cell; * As marked on the bottle; perform dissolved analyses with sample provided in bottles marked 'field filtered'*

2.7 / 1.7

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	False	Check done at department level as required.

Re: SEMIANNUAL REPORT DOCUMENTING PROGRESS IN REMEDY SELECTION
FLY ASH POND AND BOTTOM ASH POND
Cholla Power Plant – Navajo County, Arizona

In accordance with 40 Code of Federal Regulations (CFR) Section (§) 257.97(a) of the Coal Combustion Residuals (CCR) Rule, this Semiannual Remedy Selection Progress Report (Semiannual Report) has been prepared on behalf of Arizona Public Service Company (APS) to document progress in selection of remedies for CCR units which have been identified as potentially impacting groundwater at the APS Cholla Power Plant, located in Navajo County, Arizona (the Site). Applicable site CCR units include the Fly Ash Pond (FAP) and the Bottom Ash Pond (BAP). Semiannual progress reporting supporting remedy selection began on July 15, 2019. The most recent update was provided in the *Annual Groundwater Monitoring and Corrective Action Report for 2020*, dated January 31, 2021. This Semiannual Report serves as the fifth update on remedy selection progress at the site and documents activities completed to date in 2021.

1. Summary of Activities Completed in 2021

Activities completed by APS in the first half of 2021 in support of remedy selection for the FAP and the BAP include the following:

- *Aquifer Testing at the FAP*. In January 2021, Wood Environment and Infrastructure Inc. (Wood) performed several aquifer tests at four extraction wells downgradient of the FAP installed in December 2020. The aquifer tests were performed to evaluate the effectiveness of an extraction well network as a potential corrective measure. Results of the aquifer tests indicate hydraulic connectivity between three of the four extraction wells and other nearby alluvial monitoring wells. Further details of the aquifer test results and recommendations for incorporation into existing FAP seepage systems are to be outlined in a Well Completion Report. This report will be included as an appendix to the Annual Groundwater Monitoring and Corrective Action Report for 2021 (2021 GMCAR).

- *Groundwater Redox Sampling at the FAP and BAP*. Site investigations conducted to date suggest elevated concentrations of cobalt at the BAP and arsenic at the FAP may be associated with variable redox conditions in groundwater mobilizing the metals from native soil (both discussed in 2020 GMCAR). Ongoing semi-annual CCR monitoring events to date have included sampling for several redox-sensitive constituents at FAP and BAP downgradient wells. Results of the redox analyses will be evaluated in the second half of 2021 to help inform the remedy selection for the FAP and BAP.

- *Installation of Monitoring Wells and Potential Extraction Wells at the BAP*. To evaluate the nature and extent of spatially heterogenous cobalt concentrations at the BAP, Wood installed four monitoring wells downgradient of the BAP in April and May of 2021. During this time Wood also installed five 6-inch diameter wells at the south toe of the dam and adjacent to the eastern seepage intercept system of the BAP. These larger diameter wells may serve as extraction wells to enhance the BAP seepage collection systems or as part of the selected remedy, if supported by aquifer testing data (discussed in Section 2). Well installation and associated activities will be summarized in a Well Completion Report for inclusion as an appendix to the 2021 GMCAR.

- *Abandonment and Replacement of Select Site Well*s. Based on recent investigations and inspections indicating issues such as potential for cross-contamination between hydrogeologic units, nine piezometers/wells across the Site were identified for replacement. In May 2021 Wood abandoned and replaced monitoring and piezometer wells W-123, W-126, F-111, F-91, and F-91 around the FAP, and CR-1 near the SEDI. FAP extraction wells Geronimo A and Geronimo B were abandoned and replaced with a single well. The justifications for the abandonments, in addition to abandonment and replacement activities will be summarized in a Technical Memorandum (Tech Memo) to be included as an appendix to the 2021 GMCAR.

2. Future Planned Activities

APS plans to perform the following activities in support of remedy selection during the second half of 2021 (and in upcoming years, as noted):

- *Aquifer Testing at the BAP*. To support assessment of the 6-inch diameter wells installed May of 2021 to serve as extraction wells, aquifer testing and data evaluation at the BAP are currently underway. Aquifer test programs were developed for one monitoring well and four of the potential extraction wells installed to date. Further aquifer testing will be conducted at monitoring wells scheduled for installation in the second half of 2021 (see below). Results and data of all aquifer testing will be assessed and summarized as part of a Well Completion Report to be included as an appendix to the 2021 GMCAR.

- *Installation of Monitoring and Background Wells at the BAP*. To further evaluate the localized migration pathways downgradient of the BAP, four more monitoring wells are planned for installation near the southeastern corner of the BAP. Additionally, the installation of a monitoring well screened in the Moqui is planned as a potential background well for the BAP to evaluate background cobalt concentrations for the groundwater in the Moqui. Installation activities are anticipated to take place in the second half of 2021 and will be summarized in a Well Completion Report to be included as an appendix to the 2021 GMCAR.
- *BAP Bench Scale Geochemical Testing.* As part of the installation of new wells at the BAP in April-May 2021, sediment samples were taken at select locations and depth intervals during drilling. These solid matrix samples, along with additional sediment and groundwater samples to be collected during planned well installation activities, will be assessed utilizing a series of laboratory tests to evaluate the effectiveness of potential treatment technologies to treat elevated cobalt concentrations in the BAP area. The results of the laboratory testing will also guide any interim in-situ testing at the BAP. These results and any recommendations based thereupon will be summarized in a Tech Memo for inclusion the 2022 GMCAR (the results of testing will likely not be documented prior to preparation of the 2021 GMCAR).
- *Lithium Intrawell Analysis for the BAP*. In June 2019 an Alternative Source Demonstration (ASD) was prepared for lithium groundwater protection standard (GWPS) exceedances at wells downgradient of the BAP. Several lines of evidence in the ASD declared natural variation in the aquifer to be the cause of the

exceedances. As such, an intrawell statistical comparison was recommended as an alternative to the currently utilized interwell comparison for ongoing evaluation and is planned as an assessment supporting the ASD for the second half of 2021. The intrawell analyses will be summarized in a Tech Memo for inclusion as an appendix to the 2021 GMCAR.

- *Integration of New Extraction Wells into Seepage Collection System Operations at the FAP*. As part of interim response measures to address groundwater impacts at the FAP, the extraction wells installed in December 2020 will be incorporated into the existing Geronimo Seepage Collection System. Aquifer testing conducted January of 2021 support sustainable pumping rates between 1.5 and 5 gallons per minute. Completed activities associated with incorporating the extraction wells into the seepage collection system will be documented in the 2021 GMCAR.
- *Public Meeting*. Once pre-design studies have provided enough information to progress remedy selection activities (likely in 2022), APS will conduct a public meeting with interested and affected parties at least 30 days prior to selection of remedies for the FAP and the BAP pursuant to 40 CFR §257.96(e).
- *Remedy Selection Reports for the FAP and the BAP*. After a public meeting to discuss the results of the corrective measures assessment occurs, APS will prepare a remedy selection report for each CCR unit which will document how the selected remedy will meet the requirements of 40 CFR §257.97(b).

Respectfully submitted,
Wood Environment & Infrastructure Solutions, Inc.

Subject: Sedi Pond Closure by Removal and Construction Certification

Dear Mr. Conrad:

Coal Combustion Residual (CCR) removal and construction activities associated with closing the Sedi Pond CCR unit started on May 3, 2021 and were completed on October 8, 2021. These activities were completed consistent with the amended closure plan dated November 4, 2020, with the exception of the completion date. The amended closure plan for the Sedi Pond estimated a completion of closure construction activities prior to October 2021. The actual completion of construction was October 8, 2021.

A summary of Closure by Removal (CbR) construction activities is provided below:

1. Decontamination of all the existing concrete structures (divider wall, spillway, inlet structure, and outlet structure) within or associated with the CCR unit. The concrete structures were decontaminated by removing any CCR material that was adhered to the walls or footings of the structures. Upon completing decontamination activities, the concrete structures were visually inspected to verify all CCR material had been removed.
2. Demolishing and removing the decontaminated concrete structures and old pumphouse associated with the CCR unit. The concrete structures were demolished and hauled to the on-site inert landfill for disposal. The old pumphouse was cleared of any asbestos and lead paint, then was demolished for disposal or recycling.
3. Excavating and removing any remaining CCR sediments within the Sedi Pond footprint. CCR removal within the excavation was accomplished by removal of any underlying material that, by visual inspection, appeared possibly to be impacted by CCR or non-native. The CCR material and impacted soil were removed and transported to the Bottom Ash Monofill.
4. Backfilling and compacting the excavation with clean soil to fill the basin and grading the final surface to drain into existing drainage facilities.

This limited certification for closing the Sedi Pond CCR unit addresses only the removal of CCR from the CCR unit. This limited certification does not address groundwater quality monitoring concentrations relative to groundwater quality protection standards.

I, David E. Mickanen, being a Registered Professional Engineer in good standing in the State of Arizona, do hereby certify, to the best of my knowledge, information, and belief that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify, for the removal of CCR from the above-referenced CCR Unit, that the work was completed in accordance with the Closure Plan (CH_ClosPlan_004_20201104_Sedi Pond) and the requirements of 40 CFR § 257.102

AECOM

November 29, 2021

Subject: §257.103(f)(2) ANNUAL PROGRESS REPORT DOCUMENTING THE CONTINUED LACK OF ALTERNATIVE CAPACITY AND PROGRESS TOWARDS CLOSURE OF THE FAP AND BAP
Cholla Power Plant – Navajo County, Arizona

In accordance with the requirement for an annual progress report required by 40 CFR §257.103(f)(2)(x), this report documents the continued lack of alternative disposal capacity for coal combustion residuals (CCR) at the Arizona Public Service Company (APS) Cholla Power Plant. This report also describes progress made towards closure of two CCR units that APS has requested a site-specific alternative deadline to initiate closure for: the Fly Ash Pond (FAP) and the Bottom Ash Pond (BAP). Our demonstration prepared pursuant to §257.103(f)(2) was submitted to the United States Environmental Protection Agency (US EPA) on November 30, 2020 and is currently under completeness review.

Background. The 420-acre FAP and 80-acre BAP are unlined surface impoundments that receive CCR from coal-fired boiler operations at the Cholla Power Plant. In accordance with the requirements of federal CCR regulations, both the FAP and BAP must cease receiving CCR in the near term and "close for cause." Since APS plans to cease coal-fired boiler operations at Cholla Power Plant no later than April 2025 and close the FAP and BAP by October 17, 2028, APS seeks to continue receiving CCR and non-CCR wastestreams in the FAP and BAP under the alternative closure provision of §257.103(f)(2) through June 2025 to accommodate decommissioning.

Lack of Alternative Disposal Capacity. There have been no changes in alternative disposal capacity since submittal of our §257.103(f)(2) demonstration. If the FAP and BAP were not available to receive CCR, coal-fired electrical generation operations at Cholla Power Plant would need to shut down because:

- The FAP and BAP are the only existing CCR units located on-site that are sized and designed appropriately to receive CCR and non-CCR wastestreams generated by operation of Cholla Power Plant.
- Management of CCR and non-CCR wastestreams in wet temporary storage on-site is not technically feasible, let alone safe or adequately protective of the environment, given the projected volumes and the corresponding number of temporary tanks that would be required to contain the wastestreams.
- It is not technically feasible to send wet CCR off-site for disposal – there is no appropriate off-site treatment or disposal facility nearby to pipe the CCR to and trucking/conveying by rail significant quantities of liquids to an appropriate waste processing facility or landfill is unlikely to be successful. Off-site transport of this liquid CCR risks creating significant threats to public safety; these risks far out-weigh the benefit of off-site disposal of CCR.

Progress Towards Closure. Attachment D(2) of our §257.103(f)(2) demonstration identified multiple tasks required to advance closure of the FAP and BAP by October 17, 2028. An updated version of Attachment D(2) is included with this report. Progress on these tasks is as follows:

- Minimize discharge to the FAP – The only liquid discharges to the FAP at present are flue gas desulfurization (FGD) solids and small amounts of slurried non-saleable fly ash generated from operation of Cholla Power Plant Units 1 and 3. Unit 4 was permanently shut down in December 2020 which resulted in a reduction in the amount of FGD solids generated and thus discharged to the FAP in 2021. Free water level monitoring in the FAP is being conducted to track progress in dewatering the unit. Based on the results of monthly monitoring, the level of the FAP has declined by 2.1 feet thus far in 2021 which is generally consistent with annual declines over the last three years. Pond level monitoring data trends suggest that recent decreases in free water levels are largely driven by evaporation in warmer months of the year.
- Stockpile bridge lift material at the FAP – In late 2020, APS began consolidating ash excavated from a former ash disposal unit (closed prior to promulgation of the CCR Rule) to the FAP footprint to store and use as future bridge lift material during closure of the FAP. As of November 2021, approximately 700,000 cubic yards of material had been moved to the FAP footprint.
- Land Acquisition for Closure – Decommissioning and closure planning supporting the shutdown of Cholla Power Plant has necessitated a review of property ownership in the vicinity of the facility. Work supporting this review is the first step in the land acquisition process for closure and was ongoing as of the date of this progress report.

Additional activities conducted to support FAP and BAP closure include:

- FAP Dewatering – Given the results of pond level monitoring data described above, APS is developing a strategy to promote evaporation of free water in the FAP. A pilot test involving use of mechanically enhanced evaporation equipment is scheduled for 2022.
- Seepage Collection System Improvements – In late 2020 and 2021, a series of new groundwater extraction wells were installed and tested downgradient of the FAP and BAP to enhance existing seepage collection system operations and promote pond dewatering. Based on test results, APS is currently progressing detailed design of instrumentation and controls to upgrade the FAP seepage collection system. These upgrades are currently scheduled to be installed in early 2022.

If you have any questions regarding this progress report, please contact Natalie Chrisman Lazarr at 602.316.1324 or via email at natalie.chrisman@aps.com.

Sincerely,

Richard Nicosia
Plant Manager - Cholla Power Plant

ATTACHMENT D(2) – 2021 Updates in Green Text

CHOLLA POWER PLANT
CLOSURE SCHEDULE NARRATIVE
40 CFR 257.103(f)(2)(v)(D)

Arizona Public Service Company (APS) has been planning for the closure of the Fly Ash Pond (FAP) and Bottom Ash Pond (BAP) for some time. Figures D-1 (FAP Closure Activities) and D-2 (BAP Closure Activities) present Gantt charts depicting the tasks that must be completed as part of pond closure with the corresponding planned schedule for those tasks. This narrative supplements the Closure Plans presented as Attachment D(1) and presents supporting detail regarding the tasks and schedule identified in each Gantt chart.

1. Closure of the Fly Ash Pond

1.1 Pre-Construction

1.1.1 Minimize Discharge to the FAP

Continue implementing measures that limit discharges to the FAP; this activity has been ongoing since early 2016 and has included sale of fly ash to a local cement manufacturer, shut down of Unit 2 and Unit 4, diversion of water from seepage collection systems to general water (this flow previously discharged into the FAP), and various plant operational modifications. This activity will continue thru plant shut down.

1.1.2 Stockpile Closed Ash Pond 1 CCR Material for Bridge Lift

Move approximately 700,000 cubic yards (cy) of ash from closed Ash Pond 1 to a stockpile area located within the Fly Ash Pond footprint and store for utilization as bridge lift material for closure activities. This activity should require approximately 15 months depending upon contractor productivity. Work began during Third Quarter 2020 and was almost complete as of November 2021.

1.1.3 Stockpile Bottom Ash for Bridge Lift

Relocate approximately 600,000 cy of bottom ash from the Bottom Ash Monofill (BAM) to a stockpile area located within the FAP footprint and store for utilization as bridge lift material for closure activities. This work can start approximately one year prior to cessation of discharge of CCR material.

1.1.4 Land Acquisition for Closure (e.g. Diversion Channels)

No later than 3 years prior to starting closure activities, acquire land adjacent to the FAP for soil borrow areas and construction of diversion channels.

1.1.5 Run-On Diversions and Coffer (Push Up) Dams

Upstream in the drainage channels, build small retention coffer dams to capture precipitation run on. This work should start up to two years prior to cessation of discharge of CCR material.

1.1.6 Excavate Abutment Diversion Channels and Stockpile Select Soil

Start the excavation of abutment diversion channels approximately one year prior to the cessation of discharge of CCR material (as early as Second Quarter 2024).

1.1.7 Fly Ash Pond Dewatering

Design and construction of two mechanically enhanced evaporation measures for increasing the rate of evaporation and accelerating drawdown of free water within the FAP. The two enhanced evaporation measures consist of a sprinkler irrigation system and multiple floating blower fans. Planning began in 2021 and equipment will be installed as early as Second Quarter 2022.

1.2 Engineering

1.2.1 Design Engineering

Start design engineering activities in 2023; these activities will include approximately 21 months of design engineering work. The objective of these activities is to produce design drawings and specifications that will be used to procure a contractor for FAP closure activities.

1.2.2 Geotechnical and Borrow Investigations

Start the geotechnical soils evaluation after acquisition of lands adjacent to abutments. Identify usable soils for borrow materials. If possible, build roads onto the FAP beach for access of light-weight geotechnical test equipment.

1.2.3 Bridge Lift Test Fill

Start construction test fills over the CCR material exposed in the pond next to the dam embankment. Test fills to measure internal water pressures generated by bridge lift loading. Estimate techniques and materials needed to construct full-scale soil fill cap.

1.3 Permits

1.3.1 Arizona Department of Water Resources (ADWR) Dam Modifications

Anticipate that the permitting process with the ADWR Dam Safety Bureau to modify a jurisdictional high hazard dam will require nine months. Consult early with ADWR to identify if additional time is needed.

1.3.2 Arizona Department of Environmental Quality (ADEQ) or US Environmental Protection Agency (EPA) CCR Rule Closure Plan Approval

Anticipate up to six months will be required to achieve approval of proposed Closure Plan from ADEQ or US EPA if ADEQ does not have primacy.

1.4 Procurement

1.4.1 Preliminary Construction Contracts

Anticipation of six months duration for procurement of the primary construction contract (includes bid event and award of contract).

1.5 Final Boiler Closures

1.5.1 Plant Final Boiler Closures

Cease generation using coal no later than April 2025.

1.6 Construction

1.6.1 Gravity Drain Down CCR Pile

Allow up to 18 months to gravity drain the delta of CCR material adjacent to the dam. This activity may include pushing out of bridge lift material to help squeeze pore water from the CCR material. This task can begin following cessation of discharge of CCR material to the FAP.

1.6.2 Complete Diversion Channel Rock Excavations

Complete diversion channels; rock excavations started in pre-construction. Continue to segregate the selected materials for construction borrow material (activities started Second Quarter 2025).

1.6.3 Fill Remaining Water Ponds with Rockfill from Diversion Channel Cuts

Backfill remaining free water at the toe of CCR with rock fill material to entrap remaining free water this activity should coincide with the excavation of the diversion channels. Utilize rock from diversion excavation.

1.6.4 Build Rockfill Toe Buttress to Stabilize Upstream Toe of CCR Pile

Build the toe buttress with larger rock to stabilize the CCR material. This activity will coincide with the rockfill to trap the remaining free water. Can start Fourth Quarter of 2025.

1.6.5 Excavate Upstream Diversion Channels and Coffer Dams

Finish excavating upstream diversions to connect with the diversion channels around the abutments. Work starts Third Quarter of 2025 and requires 21 months.

1.6.6 Build Stormwater Detention Basins and Outlet Works

Construct stormwater detention basins which will outfall into culverts that convey water under Interstate 40.

1.6.7 Build the South and North Half Bridge Lifts and Construct Evapotranspiration (ET) Cap

Construct the bridge lifts and place the ET cap material over the supporting bridge lift material as area comes available. These construction activities will be split along the north and south halves of the pond, advancing the cap materials from southwest to northeast to squeeze pore water out of the CCR pile. ET cap placement will follow the bridge lift construction activities as areas become available. Work starts Second Quarter 2026.

1.6.8 Vegetate ET Cap

Seed the ET cap as sections are completed. Finish September or October 2028.

2. Closure of the Bottom Ash Pond

2.1 Pre-Construction

2.1.1 Land Acquisition for Closure (e.g. Diversion Channels)

No later than 3 years prior to starting closure activities, acquire land adjacent to the BAP for soil borrow areas and construction of diversion channels.

2.1.2 Stop Mining of Bottom Ash from BAP (to Bottom Ash Monofill)

Suspend removal of bottom ash from the BAP with placement of the ash in the BAM so that the material can be used in closure activities.

2.1.3 Allow Sluice of Bottom Ash into Decant Area to fill with BA

Allow ash from the plant to fill in the decant west and east cells in the BAP.

2.2 Engineering

2.2.1 Design Engineering

Design engineering activities starting in 2023 approximately 21 months of design engineering work.

2.2.2 Geotechnical and Borrow Investigations

Start the geotechnical soils evaluation after acquisition of lands adjacent to abutments. Identify usable soils for borrow materials. Build roads onto bottom ash beach areas to access light-weight geotechnical test equipment.

2.3 Permits

2.3.1 ADWR Dam Modifications

Anticipate that the permitting process with the ADWR Dam Safety Bureau to modify a jurisdictional high hazard dam will require nine months. Consult early with ADWR to identify if additional time is needed.

2.3.2 ADEQ or US EPA CCR Rule Closure Plan Approval

Anticipate up to six months will be required to achieve approval of proposed Closure Plan from ADEQ or US EPA if ADEQ does not have primacy.

2.4 Procurement

2.4.1 Preliminary Construction Contracts

Anticipation of six months duration for procurement of the primary construction contract (includes bid event and award of contract).

2.5 Final Boiler Closures

2.5.1 Plant Final Boiler Closures

Cease generation using coal no later than April 2025.

2.6 Construction Activities

2.6.1 Transfer Remaining Decant Water to General Sump for Use during Decommissioning

Siphon or pump extensively sending all free water possible to the plant for use in decommissioning activities.

2.6.2 Gravity Drain-Down CCR Pile

Allow up to 18 months to gravity drain the delta of CCR material. Activities may include the pushing out of bridge lift material to help squeeze pore water from the CCR material. Starts with the cessation of discharge of CCR material.

2.6.3 Grade Pond Using Drained Bottom Ash

Grade cut and fill utilizing drained bottom ash material to achieve the final surface configuration. This activity should start as soon as possible with the gravity drain down of the bottom ash material.

2.6.4 Excavate Upstream Diversion Channels and Retention Pond

Excavate upstream diversion channels to connect with the diversion channels around the abutments. Work will start First Quarter of 2026 and continue for 15 months.

2.6.5 Build ET Cap Using Stockpiled Soil from Diversion Channel Cuts

ET cap placement will follow the grade cut and fill construction activities as areas become available. Activities will start in Third Quarter of 2027.

2.6.6 Vegetate ET Cap

Seed the ET cap as sections are completed. Finish September or October 2028.

Figure D-1

Planned Schedule for FAP Closure Activities

Last Updated: 11.23.2021 (2021 Updates in Green Text)

NOTES:
1. Does not describe any removal of free water to Evaporation Pond or unlined basins
2. Does not describe any measures for enhancing drain down or pore pressure relief within CCR pile.
3. For cap construction, a south/north distinction has been made to allow an extra year for drain down of the more fine-grained northern half.

TASK	START	END	Duration
Pre-Construction			
Minimize discharge to FAP	20Q1	25Q2	63 months
Stockpile 700,000 cy existing fly ash for bridge lift	20Q3	22Q1	18 months
Stockpile 600,000 cy of BAM BA for bridge lift	24Q1	25Q1	12 months
Land acquisition for closure (e.g. diversion channels)	22Q1	23Q2	15 months
Run-on diversions and coffer (push up) dams	23Q2	24Q2	12 months
Excavate abutment diversion channel, stockpile select soils	24Q2	25Q2	12 months
FAP dewatering	22Q2	25Q2	36 months
Engineering			
Design engineering (SG2)	23Q1	24Q4	21 months
Geotechnical and borrow investigations	23Q2	23Q4	6 months
Bridge lift test fill	24Q2	24Q4	6 months
Permits			
ADWR dam modifications	23Q4	24Q3	9 months
ADEQ/USEPA CCR closure plan approval	24Q2	24Q4	6 months
Procurement			
Primary construction contract(s)	24Q2	24Q4	6 months
Final Boiler Closures			
Plant final boiler closures	25Q2	25Q2	0 months
Construction			
Gravity drain-down CCR pile	25Q2	26Q4	18 months
Complete diversion channel rock excavations	25Q2	26Q4	18 months
Fill remaining water ponds with rockfill from diversion channel cuts	25Q2	25Q4	6 months
Build rockfill toe buttress to stabilize upstream toe of CCR pile	25Q4	26Q2	6 months
Excavate upstream diversion channels and coffer dams	25Q3	27Q2	21 months
Build stormwater detention basins and outlet works	27Q2	28Q2	12 months
Build south half of bridge lift using stockpiled fly ash	26Q2	27Q1	9 months
Build south half of ET Cap using stockpiled soil from diversion cuts	27Q2	27Q4	6 months
Build north half of bridge lift using stockpiled fly ash	27Q1	27Q4	9 months
Build north half of ET Cap using stockpiled soil from diversion channel cuts	28Q1	28Q3	6 months
Vegetate ET cap	28Q3	28Q4	3 months

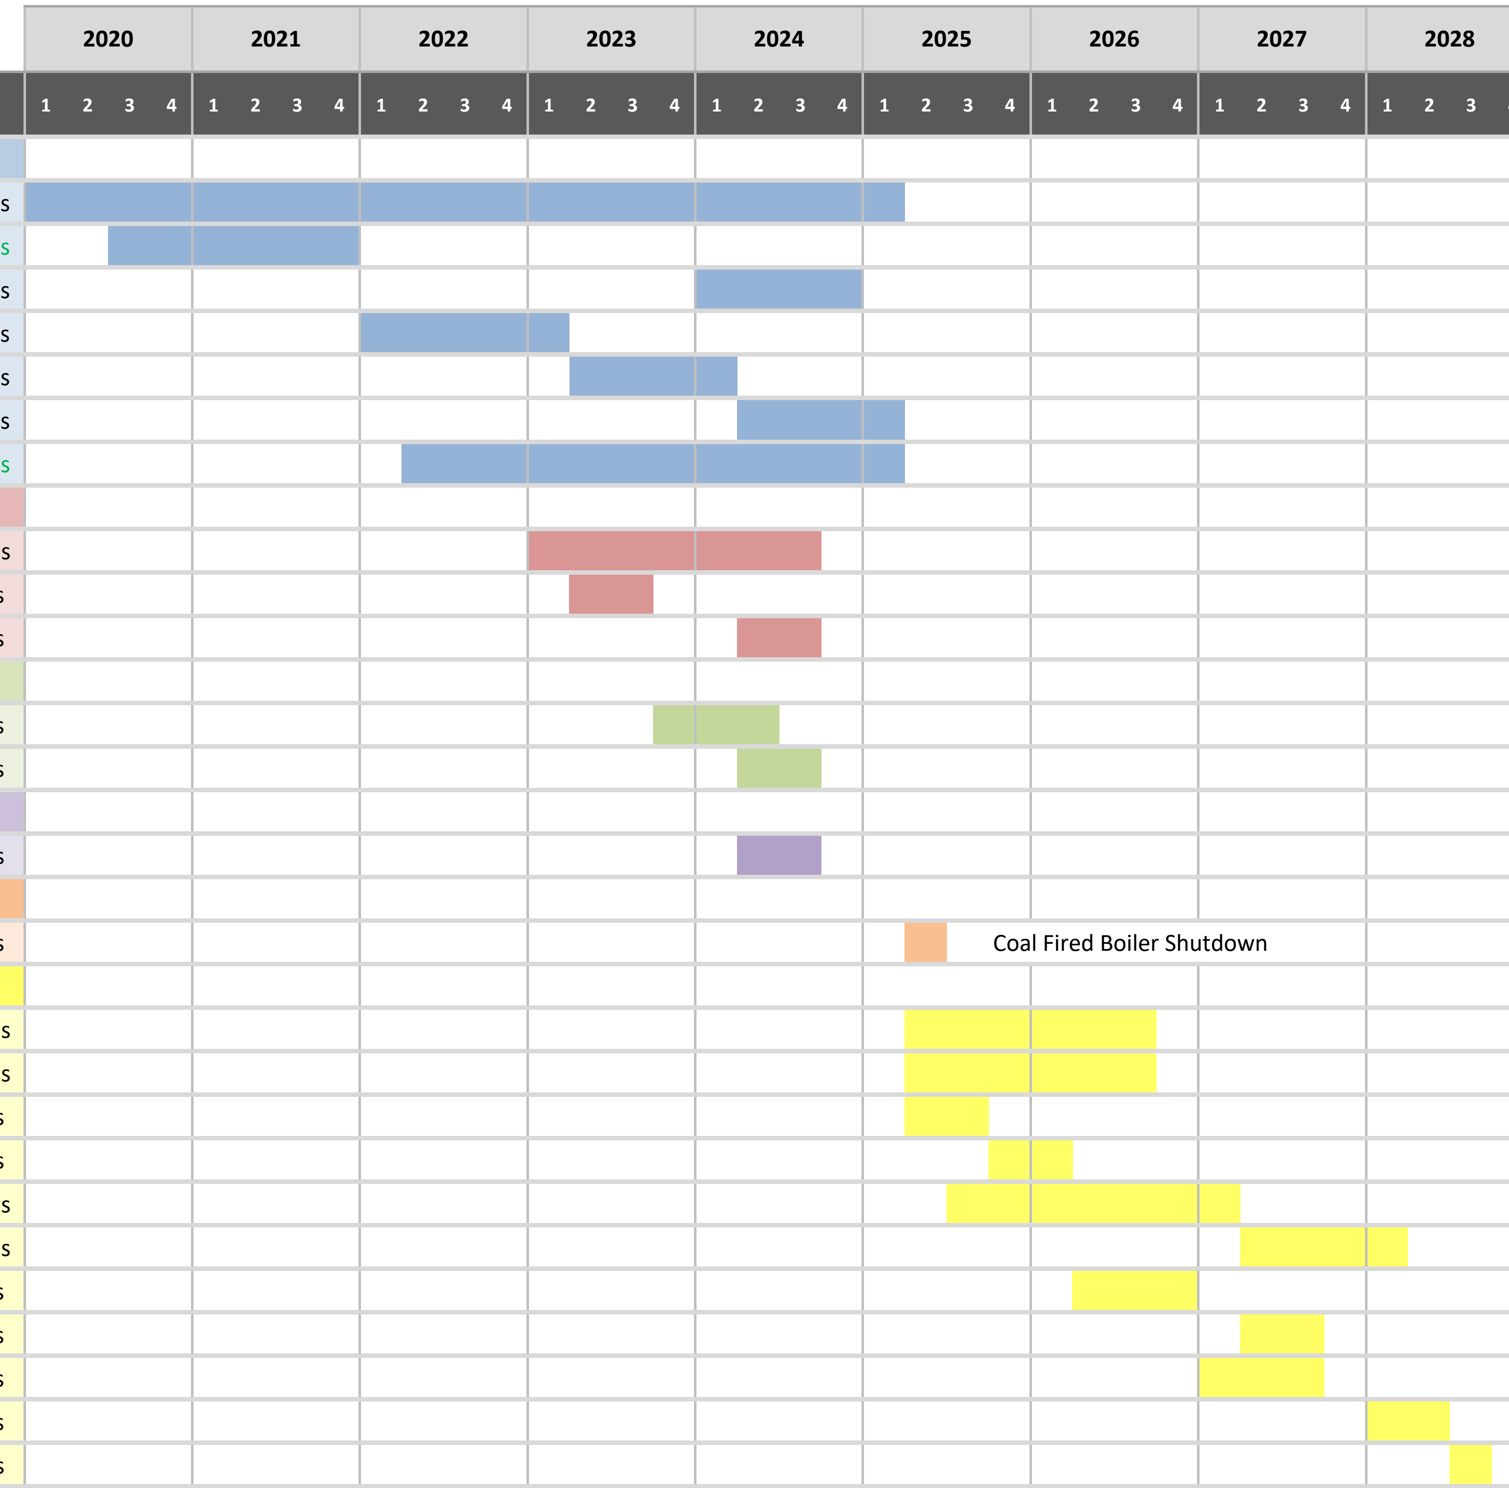

Figure D-2

Planned Schedule for BAP Closure Activities

Last Updated: 04.16.2020

NOTES:
1. Does not describe any removal of free water to Evaporation Pond or unlined basins.
2. Does not describe any measures for enhancing drain down or pore pressure relief within CCR pile.

TASK	START	END	Duration	
Pre-Construction				
Land acquisition for closure (e.g. diversion channels)	21Q1	23Q2	27 months	
Stop mining of bottom ash from BAP (to Bottom Ash Monofill)	23Q1	25Q2	27 months	
Allow sluice of bottom ash into decant area to fill with BA	23Q1	25Q2	27 months	
Engineering				
Design engineering (SG2)	23Q1	24Q4	21 months	
Geotechnical and borrow investigations	23Q2	24Q1	9 months	
Permits				
ADWR dam modifications	23Q4	24Q3	9 months	
ADEQ/USEPA CCR closure plan approval	24Q2	24Q4	6 months	
Procurement				
Primary construction contract(s)	24Q2	24Q4	6 months	
Final Boiler Closures				
Plant final boiler closures	25Q2	25Q2	0 months	Coal Fired Boiler Shutdown Date
Construction				
Transfer remaining decant water to general sump for use during decommissioning	25Q2	26Q4	18 months	
Gravity drain-down CCR pile	25Q2	26Q4	18 months	
Grade pond using drained bottom ash	26Q4	27Q3	9 months	
Excavate upstream diversion channels and retention pond	26Q1	27Q2	15 months	
Build ET Cap using stockpiled soil from diversion channel cuts	27Q3	28Q1	6 months	
Vegetate ET cap	28Q1	28Q2	3 months
