Accreditation/Certification Summary

Client: Arizona Public Service Company
Project/Site: CCR Groundwater Monitoring

Job ID: 550-210594-1
SDG: APS Four Corners Power Plant (Other)

Laboratory: Eurofins Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Arizona	State	AZ0728	06-10-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
200.8 LL	200.8	Water	Molybdenum
SM 4500 H+ B		Water	Temperature

Laboratory: Eurofins Calscience

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	Identification Number	Expiration Date
California	SCAQMD LAP	17LA0919	11-30-23
California	State	3082	07-31-24
Nevada	State	CA00111	07-31-24
Oregon	NELAP	4175	02-02-24
USDA	US Federal Programs	P330-22-00059	06-08-26
Washington	State	C916-18	10-11-23 *

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

Method Summary

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southwest, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southwest, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southwest, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*
Unconfirmed	☐ *Return To Client* ☐ *Disposal By Lab* ☐ *Archive For* _____ *Months*

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	False	Check done at department level as required.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

SDG: APS Four Corners Power Plant (Other)

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
E2	Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix.
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.

Metals

Qualifier	Qualifier Description
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.
R4	MS/MSD RPD exceeded the method control limit. Recovery met acceptance criteria.
T5	Laboratory not licensed for this parameter
V1	CCV recovery was above method acceptance limits. This target analyte was not detected in the sample.

General Chemistry

Qualifier	Qualifier Description
H1	Sample analysis performed past holding time.
H5	This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time.
T5	Laboratory not licensed for this parameter

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 550-210744-1

Laboratory: Eurofins Phoenix

Narrative

Job Narrative
550-210744-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/17/2023 4:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.0°C and 3.1°C

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 200.8_CWA_LL: Samples diluted 10x for sample matrix

FC-CCR-MW11-1123 (550-210744-2), FC-CCR-EW17-1123 (550-210744-6), FC-CCR-EW12R-1123 (550-210744-7), FC-CCR-EW11R-1123 (550-210744-8), FC-CCR-EW14-1123 (550-210744-9), FC-CCR-EW15-1123 (550-210744-10), FC-CCR-MW34-1123 (550-210744-11), (550-210594-A-21-C), (550-210594-A-21-A MS) and (550-210594-A-21-B MSD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2540C_Calcd: The following samples were analyzed outside of analytical holding time due to Analyst scheduling error: FC-CCR-DMX05R-1123 (550-210744-5), FC-CCR-EW12R-1123 (550-210744-7), FC-CCR-EW11R-1123 (550-210744-8), FC-CCR-EW14-1123 (550-210744-9), FC-CCR-EW15-1123 (550-210744-10), FC-CCR-MW34-1123 (550-210744-11) and FC-CCR-EB01-1123 (550-210744-12).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Accreditation/Certification Summary

Client: Arizona Public Service Company
Project/Site: CCR Groundwater Monitoring

Job ID: 550-210744-1
SDG: APS Four Corners Power Plant (Other)

Laboratory: Eurofins Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Arizona	State	AZ0728	06-10-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
200.8 LL	200.8	Water	Molybdenum
SM 4500 H+ B		Water	Temperature

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Arizona	State	AZ0830	11-16-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
200.7 Rev 4.4	200.7	Water	Lithium

550-210744 Chain of Custody

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southwest, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southwest, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southwest, LLC.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
E2	Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix.
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.

Metals

Qualifier	Qualifier Description
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.
R4	MS/MSD RPD exceeded the method control limit. Recovery met acceptance criteria.
T5	Laboratory not licensed for this parameter
V1	CCV recovery was above method acceptance limits. This target analyte was not detected in the sample.

General Chemistry

Qualifier	Qualifier Description
H1	Sample analysis performed past holding time.
H5	This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time.
T5	Laboratory not licensed for this parameter

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
550-210744-1

REVISION

The report being provided is a revision of the original report sent on 12/7/2023. The report (revision 2) is being revised due to The client is requesting Co, Pb, and Mo by method 200.8 for samples -1,-3,-4,-5,12.

Report revision history
Revision 1 - 12/19/2023 - Reason - Client only needed Cl reported for samples -6 thru -11. Samples were logged in for Cl, F, SO4. The report was not sent to client..

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/17/2023 4:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.0°C and 3.1°C

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 200.8_CWA_LL: Samples diluted 10x for sample matrix

FC-CCR-MW11-1123 (550-210744-2), FC-CCR-EW17-1123 (550-210744-6), FC-CCR-EW12R-1123 (550-210744-7), FC-CCR-EW11R-1123 (550-210744-8), FC-CCR-EW14-1123 (550-210744-9), FC-CCR-EW15-1123 (550-210744-10), FC-CCR-MW34-1123 (550-210744-11), (550-210594-A-21-C), (550-210594-A-21-A MS) and (550-210594-A-21-B MSD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2540C_Calcd: The following samples were analyzed outside of analytical holding time due to Analyst scheduling error: FC-CCR-DMX05R-1123 (550-210744-5), FC-CCR-EW12R-1123 (550-210744-7), FC-CCR-EW11R-1123 (550-210744-8), FC-CCR-EW14-1123 (550-210744-9), FC-CCR-EW15-1123 (550-210744-10), FC-CCR-MW34-1123 (550-210744-11) and FC-CCR-EB01-1123 (550-210744-12).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southwest, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southwest, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southwest, LLC.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of analyte.
D5	Minimum Reporting Limit (MRL) adjusted due to sample dilution; analyte was non-detect in the sample.
E2	Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix.
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.

Metals

Qualifier	Qualifier Description
L3	The associated blank spike recovery was above method acceptance limits.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable.
R4	MS/MSD RPD exceeded the method control limit. Recovery met acceptance criteria.
T5	Laboratory not licensed for this parameter

General Chemistry

Qualifier	Qualifier Description
H5	This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time.
T5	Laboratory not licensed for this parameter

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 550-210745-1

Laboratory: Eurofins Phoenix

Narrative

Job Narrative
550-210745-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/17/2023 4:45 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.0°C

HPLC/IC
Method 300_ORGFMS: The following sample was diluted due to high salt concentrations in the sample matrix: FC-CCR-MW07-1123 (550-210745-1). Elevated reporting limits (RL) are provided. To preserve the instrumentation, samples containing high levels of salts are required to be diluted by a factor of two.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 200.8_CWA_LL: The laboratory control sample (LCS) associated with preparation batch 550-311488 and analytical batch 550-311753 was outside acceptance criteria for the analyte Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. FC-CCR-MW07-1123 (550-210745-1), FC-CCR-MW08-1123 (550-210745-2) and FC-CCR-MW49A-1123 (550-210745-3)

Method 200.8_CWA_LL: Samples diluted 10x for sample matrix

FC-CCR-MW07-1123 (550-210745-1), FC-CCR-MW08-1123 (550-210745-2), FC-CCR-MW49A-1123 (550-210745-3), (550-210594-A-21-C), (550-210594-A-21-A MS) and (550-210594-A-21-B MSD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Sample Summary

Client: Arizona Public Service Company
Project/Site: CCR Groundwater Monitoring

1 INTRODUCTION

Arizona Public Service (APS) collected groundwater Detection and Assessment Monitoring samples to support Coal Combustion Residuals (CCR) Rule Compliance during the 2023 calendar year (the reporting period) at the APS Four Corners Power Plant, located near Fruitland, New Mexico. This report presents the standard methods used to validate reporting period data and documents the results of the data validation process in summary tables and checklists generated as the samples were collected throughout the year.

2 DATA VALIDATION METHODOLOGY

WSP USA Environment & Infrastructure Inc (WSP) performed a United States Environmental Protection Agency (EPA) Stage 2A validation on samples collected by APS during the 2023 calendar year. This is equivalent to a Level I data evaluation as defined in the project sampling and analysis plan (SAP). The Stage 2A validation includes review of the quality control (QC) results in laboratory analytical reports and does not include review or validation of the raw analytical data. Data validation activities have been performed in general accordance with:

- EPA, 2004. SW 846 Test Methods for Evaluating Solid Wastes, Update IIIB.
- EPA, 2017. EPA Contract Laboratory Program (CLP) National Functional Guidelines for Inorganic Superfund Data Review, EPA 540-R-2017-001.
- Wood, 2022. Groundwater Sampling and Analysis Program, Coal Combustion Residuals Rule Groundwater Monitoring System Compliance, Four Corners Power Plant, Fruitland, New Mexico.

The CLP guidelines were written specifically for the CLP, and have been modified for the purposes of data reviews conducted during the reporting period where they differ from method-specific QC requirements.

During each groundwater monitoring round conducted during the reporting period, the laboratory's certified analytical report and supporting documentation were reviewed to assess the following:

- Data package and electronic data deliverable completeness;
- Chain of custody (COC) compliance;
- Holding time compliance;
- Presence or absence of laboratory contamination as demonstrated by laboratory blanks;
- Accuracy and bias as demonstrated by recovery of laboratory control sample (LCS) and matrix spike (MS) samples;
- Analytical precision as relative percent difference (RPD) of analyte concentration between laboratory duplicates, LCS/LCS duplicates (LCSDs), or MSs/MS duplicates (MSDs);
- Insofar as possible, the degree of conformance to method requirements and good laboratory practices.

Appendix A presents data assessment checklists generated for each sample delivery group submitted to the analytical laboratory during the reporting period. The laboratory performing the analyses as well as the methods of analysis are presented in the individual checklists. **Table 1** presents a comprehensive listing of reporting period samples and **Table 2** summarizes field duplicate detections at concentrations greater than analytical reporting limits.

In general, it is important to recognize that no analytical data are guaranteed to be correct, even if all QC audits are passed. Strict QC serves to increase confidence in data, but any reported value may potentially contain error.

3 EXPLANATION OF DATA QUALITY INDICATORS

Summary explanations of the specific data quality indicators reviewed during data validation are presented below.

3.1 LABORATORY CONTROL SAMPLE RECOVERIES

LCSs are aliquots of analyte free matrices that are spiked with the analytes of interest for an analytical method, or a representative subset of those analytes. The spiked matrix is then processed through the same analytical procedures as the samples it accompanies. LCS recovery is an indication of a laboratory's ability to successfully perform an analytical method in an interference free matrix.

3.2 MATRIX SPIKE RECOVERIES

MSs and MSDs are prepared by adding known amounts of the analytes of interest for an analytical method, or a representative subset of those analytes, to an aliquot of sample. The spiked sample is then processed through the same extraction, concentration, cleanup, and analytical procedures as the unspiked samples in an analytical batch.

MS recovery and precision are an indication of a laboratory's ability to successfully recover an analyte in the matrix of a specific sample or closely related sample matrices. It is important not to apply MS results for any specific sample to other samples without understanding how the sample matrices are related.

3.3 BLANK CONCENTRATIONS

Blank samples are aliquots of analyte free matrix that are used as negative controls to verify that the sample collection, storage, preparation, and analysis system does not produce false positive results.

Laboratory blanks are processed by the laboratory using exactly the same procedures as the field samples. Target analytes should not be found in laboratory blanks.

When target analytes are detected in blanks, analyte concentrations in associated samples less than five times the concentration detected in the blank will be U qualified as being not detected.

3.4 LABORATORY DUPLICATES

Laboratory duplicate analysis verifies acceptable method precision by the laboratory at the time of preparation and analysis and/or sampling precision at the time of collection.

4 DEFINITIONS OF DATA VALIDATION QUALIFIERS

The following qualifiers may be added to the data during data validation:

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to measure the analyte accurately and precisely in the sample.

5 CHAIN OF CUSTODY AND SAMPLE RECEIPT CONDITION DOCUMENTATION

Unless otherwise noted in the Data Assessment Checklists included in **Appendix A**, the samples were received at the laboratories under proper COC, intact, properly preserved, and at temperatures less than the SAP-specified maximum of 6 degrees Celsius.

6 SPECIFIC DATA VALIDATION FINDINGS

Results for groundwater monitoring samples collected in 2023 may be considered usable with the limitations and exceptions summarized in **Table 3**.

The following sections identify requirements used in data assessment. Laboratory-specified limits are noted on the Data Assessment Checklists included in **Appendix A**.

6.1 METALS BY EPA METHODS 200.7, 200.8, AND 245.1

6.1.1 HOLDING TIMES

Samples must be analyzed for metals within the SAP-specified holding time of 28 days for mercury and 180 days for additional metals.

6.1.2 LABORATORY BLANKS

Target analytes must not be detected in the laboratory blanks associated with the analysis of site samples.

6.1.3 LABORATORY CONTROL SAMPLE ACCURACY AND PRECISION

LCS and LCSD recoveries must be within the laboratory-specified limits and RPDs between the LCS and LCSD results must be less than the laboratory-specified maximum.

6.1.4 MATRIX SPIKES/MATRIX SPIKE DUPLICATES

Laboratories performed MS and MSD analysis on the project samples specified in the Data Assessment Checklists included in **Appendix A**. MS/MSD recoveries must be within laboratory-specified limits and RPDs between MS and MSD results must be less than the laboratory-specified maximum.

6.1.5 ANALYTICAL SENSITIVITY

Reporting levels (RLs) for antimony, arsenic, barium, beryllium, cadmium, chromium, mercury, selenium, and thallium must be sufficiently low to meet the National Primary Drinking Water Regulation Maximum Contamination Limits (MCLs). RLs or cobalt, lead, lithium, and molybdenum must be sufficiently low to meet alternative Groundwater Protection Standards (GWPSs).

Boron and calcium are not EPA-regulated analytes in groundwater, and it is not possible to evaluate the RLs for these analytes against the National Primary Drinking Water Regulation MCLs.

6.2 ANIONS BY EPA METHOD 300.0

6.2.1 HOLDING TIMES

Samples must be analyzed for anions within the SAP-specified holding time of 28 days.

6.2.2 LABORATORY BLANKS

Fluoride, chloride, and sulfate must not be detected in the laboratory blanks associated with the analysis of these samples.

6.2.3 LABORATORY CONTROL SAMPLE ACCURACY AND PRECISION

LCS and LCSD recoveries must be within the laboratory-specified limits and RPDs between the LCS and LCSD results must be less than the laboratory-specified maximum values.

6.2.4 MATRIX SPIKES/MATRIX SPIKE DUPLICATES

Laboratories performed MS and MSD analysis on the project samples specified in the Data Assessment Checklists included in **Appendix A**. Recoveries must be within the laboratory-specified limits. RPDs between MS and MSD results must be less than the laboratory-specified limit.

6.2.5 LABORATORY DUPLICATES

Laboratories performed duplicate analysis on the project samples specified in the Data Assessment Checklists included in **Appendix A**. The RPDs between duplicate results must be less than the laboratory-specified limit.

6.2.6 ANALYTICAL SENSITIVITY

Fluoride RLs must be sufficiently low to meet the 4 milligrams per liter (mg/L) MCL. Chloride and sulfate are not EPA-regulated analytes in groundwater, and it is not possible to evaluate the RLs for these analytes against the Primary Drinking Water Regulation MCLs.

There are applicable CCR Groundwater Monitoring Program Background Threshold Values (BTVs) for fluoride, chloride, and sulfate for the site. Analytical sensitivity must also be evaluated for these site-specific comparison criteria.

6.3 TOTAL DISSOLVED SOLIDS BY SM 2540C

6.3.1 HOLDING TIMES

All samples must be analyzed for TDS within the SAP-specified holding time of 7 days.

6.3.2 LABORATORY BLANKS

TDS must not be detected in the laboratory blanks at concentrations above the reporting limit.

6.3.3 LABORATORY CONTROL SAMPLE ACCURACY AND PRECISION

LCS and LCSD recoveries must be within the laboratory-specified limits and RPDs between the LCS and LCSD results must be less than the laboratory-specified maximum.

6.3.4 LABORATORY DUPLICATES

Laboratories performed duplicate analysis for TDS on the project samples specified in the Data Assessment Checklists included in **Appendix A**. RPDs between primary sample and laboratory duplicate results must be less than the laboratory-specified limit.

6.4 PH BY SM 4500B

6.4.1 HOLDING TIMES

All samples must be analyzed for pH within 15 minutes of sample collection.

6.4.2 LABORATORY CONTROL SAMPLE ACCURACY AND PRECISION

LCS recoveries must be within the laboratory-specified limits.

6.4.3 LABORATORY DUPLICATES

Laboratories performed duplicate analysis for pH on the project samples specified in the Data Assessment Checklists included in **Appendix A**. RPDs between primary sample and laboratory duplicate results must be less than the laboratory-specified limit.

6.5 GENERAL CHEMISTRY BY SM 2320B

6.5.1 HOLDING TIMES

Samples must be analyzed for alkalinity within 14 days of sample collection.

6.5.2 LABORATORY CONTROL SAMPLE ACCURACY AND PRECISION

LCS recoveries must be within the laboratory-specified limits.

6.5.3 LABORATORY DUPLICATES

Laboratories performed duplicate analysis on the project samples specified in the Data Assessment Checklists included in **Appendix A.** RPDs between primary sample and laboratory duplicate results must be less than the laboratory-specified limit.

6.6 RADIUM BY EPA METHODS 903.0 AND 904.0

6.6.1 HOLDING TIME

All samples must be analyzed for radium within the EPA-recommended holding time of 6 months.

6.6.2 LABORATORY BLANKS

Radium must not be detected in the laboratory blanks at concentrations above the reporting limit.

6.6.3 LABORATORY CONTROL SAMPLE ACCURACY AND PRECISION

LCS and LCSD recoveries must be within laboratory-specified limits.

6.6.4 CARRIER ACCURACY

Carrier recoveries must be within the laboratory-specified limits.

6.6.5 ANALYTICAL SENSITIVITY

Total radium RLs must be sufficiently low to meet the MCL of 5 picocuries per liter. Pending development of applicable CCR Groundwater Monitoring Program BTVs and/or GPSs for the site, analytical sensitivity must also be evaluated for these site-specific comparison criteria.

7 FIELD DUPLICATES

APS collected field duplicate samples of the specified field original samples as specified in **Table 1**. Target analyte detections are summarized in **Table 2.** Precision values must be less than or equal-to the SAP-specified maximum of 20 percent (%), or the differences between the detected concentrations must be less than or equal-to the RLs.

8 SUMMARY AND CONCLUSIONS

Data are usable with the addition of qualifiers as presented in **Table 3**. The amount of qualified data was reduced by approximately 16% compared to the 2022 data. Similarly to past sampling events, the primary data qualifier reason code for 2023 qualified data was holding time exceedances for pH by SM 4500B. However, significantly more data included J-qualifiers for high laboratory control sample recoveries in 2023 when compared to past sampling events. Approximately (55) 2023 analytical results included J-qualifiers for high laboratory control sample recoveries in 2023 and no data included J-qualifiers for this same reason in 2022.

9 LIMITATIONS

This report was prepared exclusively for Arizona Public Service by WSP USA Environment & Infrastructure, Inc. The quality of information, conclusions, and estimates contained herein is consistent with the level of effort involved in WSP services and based on: i) information available at the time of preparation, ii) data supplied by outside sources, and iii) the assumptions, conditions, and qualifications set forth in this report. This data validation report is intended to be used by Arizona Public Service for the Four Corners Power Plant site only, subject to the terms and conditions of its contract with WSP. Any other use of, or reliance on, this report by any third party is at that party's sole risk.

FC-CCR-MW75-1123	J210429	pH	8.3 SU	J HT

Notes:
ug/L = micrograms per liter
mg/L = milligrams per liter
SU = standard pH units
pCi/L = picocurie per liter

Qualifier Definition:
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
R = The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Reason Codes:
FD = Imprecision between primary and field duplicate results.
HD = Imprecision between LCS and LCSD recoveries.
HL = High laboratory control sample recovery.
HT = The maximum recommended hold time was exceeded and the result should be considered an estimated value.
LM = Low matrix spike recovery. Result may be biased low.
MI = Potential matrix interference.
PJ = Professional judgement. Though the spike concentration is too low to assess accuracy based on MS recovery, the concentration detected in the MS and/or MSD is significantly lower than the concentration detected in the unspiked native sample.

Analytical Methods:

Analyte	Analyte Group	Method
Radium 226, Radium 228, Total Radium	Radionuclides	HPGE

Qualifier Definitions:

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete? (Yes) No

If No, provide details.

Sample Login Matched COC? Yes (No)

If no, provide details.

Sample FC-CCR-FD08-0523 was logged in with a sample ID of FC-CCR-SWFD08-0523 while the COC listed a sample ID of FC-CCR-FD08-0523. For the remainder of this report, this sample is referred to as FC-CCR-FD08-0523 per the COC.

Sample receipt temperature ≤ 6°C? Yes No (N/A)

If no, provide details.

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

   (Yes) No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

   Yes No (N/A)

3. Samples Analyzed for alkalinity within 14 days of sampling? Yes No (N/A)

4. Samples analyzed for total dissolved solids within 7 days of sampling?

   Yes No (N/A)

5. Samples analyzed for pH within 15 minutes of sampling? Yes No (N/A)

If No:

Sample ID	Analysis	Time Between Collection and Analysis	Effect on Data Usability

6. Target analytes detected in the blanks? (Yes) No N/A

If Yes:

Detected Analyte	Concentration	Samples with concentrations less than 5 times the blank detection	Effect on Data Usability
Radium 228	0.9 ± 0.5 pCi/L	The equipment blank was not associated with any samples reviewed in this report.	None
Total Radium	0.9 ± 0.5 pCi/L	The equipment blank was not associated with any samples reviewed in this report.	None

Abbreviations:
pCi/L = picoCuries per liter

7. LCS recoveries within laboratory-specified limits? Yes No (N/A)

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability

8. MS performed on a project-specific sample? Yes No (N/A)

If Yes:

Spiked Sample ID	Spiked Analyte(s)

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes No (N/A)

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability

9. Field duplicate collected? (Yes) No

If Yes:

Parent Sample	Field Duplicate
FC-CCR-MW86-0523	FC-CCR-FD02-0523
FC-CCR-SW1-0523	FC-CCR-FD08-0523

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

(Yes) No N/A

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes (No) N/A

If Yes:

Sample ID	Analysis

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes No (N/A)

If No:

Sample ID	Analyte	Effect on Data Usability

11. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

(Yes) No

Analyte	List	MCL	Alternative GWPS	Units
Antimony	Appendix IV	0.006	--	mg/L

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete? (Yes) No

If No, provide details.

Sample Login Matched COC? (Yes) No

If no, provide details.

Sample receipt temperature ≤ 6°C? Yes No (N/A)

If no, provide details.

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

   (Yes) No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

   Yes No (N/A)

3. Samples Analyzed for alkalinity within 14 days of sampling? Yes No (N/A)

4. Samples analyzed for total dissolved solids within 7 days of sampling?

   Yes No (N/A)

5. Samples analyzed for pH within 15 minutes of sampling? Yes No (N/A)

If No:

Sample ID	Analysis	Time Between Collection and Analysis	Effect on Data Usability

6. Target analytes detected in the blanks? Yes No (N/A)

If Yes:

Detected Analyte	Concentration	Samples with concentrations less than 5 times the blank detection	Effect on Data Usability

7. LCS recoveries within laboratory-specified limits? Yes No (N/A)

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability

8. MS performed on a project-specific sample? Yes No (N/A)

If Yes:

Spiked Sample ID	Spiked Analyte(s)

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes No (N/A)

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability

9. Field duplicate collected? Yes (No)

If Yes:

Parent Sample	Field Duplicate

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

Yes No (N/A)

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes (No) N/A

If Yes:

Sample ID	Analysis

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes No (N/A)

If No:

Sample ID	Analyte	Effect on Data Usability

11. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

Yes (circled) No

11. Other quality control issues? (Yes) No

If Yes:

According to the case narrative, arsenic recovery was high in a continuing calibration verification (CCV) associated with the analysis of samples FC-CCR-MW07-0523, FC-CCR-MW08-0523, and FC-CCR-MW49A-0523. Arsenic was not detected in the associated samples and data usability is not adversely affected by the high CCV recovery.

12. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

Yes (No)

Four Corners CCR Data Review

Laboratory Name:	Eurofins Environment Testing		
Sample Delivery Group:	J202031	**Review Date:**	6/20/2023
Validator's Name:	Marie Bevier	**Reviewed By:**	Bjorn Ottosson

Sample Summary:

Field Sample Identification	Collection Date and Time	Laboratory Sample Identification	Notes
FC-CCR-MW67-0523	05/09/23 13:25	550-202031-1	
FC-CCR-MW68-0523	05/09/23 10:49	550-202031-2	
FC-CCR-MW69-0523	05/09/23 10:07	550-202031-3	
FC-CCR-MW71-0523	05/09/23 19:13	550-202031-4	
FC-CCR-MW72-0523	05/09/23 18:14	550-202031-5	
FC-CCR-MW84-0523	05/09/23 12:39	550-202031-6	
FC-CCR-MW85-0523	05/09/23 14:13	550-202031-7	
FC-CCR-CM01-0523	05/09/23 11:43	550-202031-8	
FC-CCR-CM02-0523	05/09/23 11:48	550-202031-9	
FC-CCR-FD01-0523	05/09/23 16:20	550-202031-10	Field duplicate of FC-CCR-MW84-0523

Analytical Methods:

Analyte	Analyte Group	Method
Chloride, Fluoride, Sulfate	Anions	EPA 300.0
Beryllium, Lithium, Boron, Calcium	Metals	EPA 200.7
Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Nickel, Selenium, Thallium	Metals	EPA 200.8
Mercury	Metals	EPA 245.1
Total Dissolved Solids (TDS)	General Chemistry	SM 2540C
pH	General Chemistry	SM 4500 H+B

Qualifier Definitions:

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete? (Yes) No

If No, provide details.

Sample Login Matched COC? (Yes) No

If no, provide details.

Sample receipt temperature ≤ 6°C? Yes (No) N/A

If no, provide details.

The temperature was recorded as 13.1 °C upon receipt at Eurofins Denver. Denver analyzed the samples for metals, which do not require thermal preservation and data usability is not adversely affected by the elevated sample receipt temperature.

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

   (Yes) No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

   (Yes) No N/A

3. Samples Analyzed for alkalinity within 14 days of sampling? (Yes) No N/A

4. Samples analyzed for total dissolved solids within 7 days of sampling?

   (Yes) No N/A

5. Samples analyzed for pH within 15 minutes of sampling? Yes (No) N/A

If No:

Sample ID	Analysis	Time Between Collection and Analysis	Effect on Data Usability
FC-CCR-MW67-0523	pH	8 days, 2 hours, 25 minutes	J, HT
FC-CCR-MW68-0523	pH	8 days, 5 hours, 4 minutes	J, HT
FC-CCR-MW69-0523	pH	8 days, 5 hours, 48 minutes	J, HT
FC-CCR-MW71-0523	pH	8 days, 20 hours, 43 minutes	J, HT
FC-CCR-MW72-0523	pH	8 days, 21 hours, 44 minutes	J, HT
FC-CCR-MW84-0523	pH	8 days, 3 hours, 20 minutes	J, HT
FC-CCR-MW85-0523	pH	8 days, 1 hour, 47 minutes	J, HT
FC-CCR-CM01-0523	pH	8 days, 4 hours, 18 minutes	J, HT
FC-CCR-CM02-0523	pH	8 days, 4 hours, 15 minutes	J, HT
FC-CCR-FD01-0523	pH	7 days, 23 hours, 44 minutes	J, HT

Note:

HT = Maximum recommended hold time was exceeded.

6. Target analytes detected in the blanks? Yes (No) N/A

If Yes:

Detected Analyte	Concentration	Samples with concentrations less than 5 times the blank detection	Effect on Data Usability

7. LCS recoveries within laboratory-specified limits? (Yes) No N/A

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability

8. MS performed on a project-specific sample? (Yes) No N/A

If Yes:

Spiked Sample ID	Spiked Analyte(s)
FC-CCR-MW67-0523	Lithium

a. Are MS recoveries and/or precision within laboratory specified limits?

(Yes) No N/A

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability

9. Field duplicate collected? (Yes) No

If Yes:

Parent Sample	Field Duplicate
FC-CCR-MW84-0523	FC-CCR-FD01-0523

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

(Yes) No N/A

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

(Yes) No N/A

If Yes:

Sample ID	Analysis
FC-CCR-MW84-0523	TDS
FC-CCR-MW68-0523	pH

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

(Yes) No N/A

If No:

Sample ID	Analyte	Effect on Data Usability

11. Other Quality Control Issues? (Yes) No

If Yes:

According to the case narrative, arsenic recovery was high in a continuing calibration verification associated with the analysis of samples FC-CCR-CM01-0523, FC-CCR-CM02-0523, FC-CCR-FD01-0523, FC-CCR-MW84-0523, and FC-CCR-MW85-0523. Arsenic was not detected in the associated samples and data usability is not adversely affected by the high recovery.

According to the case narrative, constant weight was not achieved after three drying cycles in the TDS analysis of samples FC-CCR-MW67-0523 and FC-CCR-MW69-0523. WSP J qualified the TDS results from these samples because of potential matrix interference. (J, MI)

Note:

MI = Potential matrix interference.

12. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

Yes (No)

Analyte	List	MCL	Alternative GWPS	Units
Antimony	Appendix IV	0.006	--	mg/L

6. Target analytes detected in the blanks? (Yes) No N/A

If Yes:

Detected Analyte	Concentration	Samples with concentrations less than 5 times the blank detection	Effect on Data Usability
Calcium	239 µg/L	None	None
TDS	26 mg/L	None	None

7. LCS recoveries within laboratory-specified limits? (Yes) No N/A

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability

8. MS performed on a project-specific sample? (Yes) No N/A

If Yes:

Spiked Sample ID	Spiked Analyte(s)
FC-CCR-DMX01-0523 FC-CCR-MW30-0523 FC-CCR-MW52-0523 FC-CCR-MW79S-0523 FC-CCR-MW81-0523	Cobalt, Molybdenum
FC-CCR-DMX03-0523 FC-CCR-DMX04-0523	Beryllium, Boron, Calcium, Iron, Lithium, Magnesium, Manganese, Potassium, Sodium
FC-CCR-MW57-0523	Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Nickel, Selenium, Thallium
FC-CCR-MW60-0523	Beryllium, Boron
FC-CCR-MW62-0523 FC-CCR-MW63-0523	Beryllium, Boron, Calcium, Lithium
FC-CCR-MW77S-0523	Boron
FC-CCR-SUMP1-0523	Chloride, Fluoride, Sulfate

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes (No) N/A

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability
FC-CCR-DMX01-0523 (FC-CCR-FD04-0523)	Cobalt	91%, MSD	92 to 115%	J, LM
FC-CCR-DMX03-0523	Magnesium Sodium	240%, -308% 207%, 30%	70 to 130%	NA4
FC-CCR-DMX04-0523	Sodium	327%, MS	70 to 130%	NA4
C-CCR-MW60-0523	Boron	6%, MS	70 to 130%	NA4
FC-CCR-MW62-0523	Calcium	61%, MSD	70 to 130%	NA4
FC-CCR-MW79S-0523	Cobalt	86%, 91%	92 to 115%	J, LM
FC-CCR-SUMP1-0523	Sulfate	59%, 69%	80 to 120%	NA4

Notes:
LM = low MS recovery. Result may be biased low.
NA4 = The concentration detected in the unspiked native sample is more than four times the spike concentration and it is not possible to assess analytical accuracy for this analyte in this sample based on the matrix spike recovery.

9. Field duplicate collected? (Yes) No

If Yes:

Parent Sample	Field Duplicate

FC-CCR-MW19-0523	FC-CCR-FD05-0523
FC-CCR-MW30-0523	FC-CCR-FD06-0523
FC-CCR-MW81-0523	FC-CCR-FD07-0523
FC-CCR-SW1-0523	FC-CCR-FD08-0523

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

(Yes) No N/A

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD or Difference	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

(Yes) No N/A

If Yes:

Sample ID	Analysis
FC-CCR-DMX03-0523, FC-CCR-DMX04-0523, FC-CCR-MW23R-0523, FC-CCR-MW38R-0523, FC-CCR-MW63-0523, FC-CCR-MW83-0523, FC-CCR-SUMP11-0523	TDS
FC-CCR-FD02-0523, FC-CCR-MW18-0523, FC-CCR-MW65-0523	pH
FC-CCR-MW11-0523, FC-CCR-MW36R-0523, FC-CCR-MW61-0523	Alkalinity

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

(Yes) No N/A

If No:

Sample ID	Analyte	Effect on Data Usability

11. Other quality control Issues? (Yes) No

If Yes:

According to the case narrative, samples FC-CCR-MW87-0523, FC-CCR-SUMP15-0523, and FC-CCR-SW3-0523 did not reach constant weight after three drying cycles. WSP J qualified the TDS results from these samples because of potential matrix interference, (J, MI)

Note:

MI = Potential matrix interference.

12. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

Yes (No)

Analytical Methods:

Analyte	Analyte Group	Method
Radium 226, Radium 228, Total Radium	Radionuclides	HPGE

Qualifier Definitions:

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete? Yes (No)

If No, provide details.

The collection time for sample FC-CCR-MW61-1123 was missing on the COC.

Sample Login Matched COC? Yes (No)

If no, provide details.

The collection time for sample FC-CCR-MW61-1123 was missing on the COC, but the sample was logged with a collection time of 12:50.

Sample receipt temperature ≤ 6°C? Yes No (N/A)

If no, provide details.

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

   (Yes) No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

   Yes No (N/A)

3. Samples Analyzed for alkalinity within 14 days of sampling? Yes No (N/A)

4. Samples analyzed for total dissolved solids within 7 days of sampling?

   Yes No (N/A)

5. Samples analyzed for pH within 15 minutes of sampling? Yes No (N/A)

If No:

Sample ID	Analysis	Time Between Collection and Analysis	Effect on Data Usability

6. Target analytes detected in the blanks? Yes No (N/A)

If Yes:

Detected Analyte	Concentration	Samples with concentrations less than 5 times the blank detection	Effect on Data Usability

7. LCS recoveries within laboratory-specified limits? Yes No (N/A)

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability

8. MS performed on a project-specific sample? Yes No (N/A)

If Yes:

Spiked Sample ID	Spiked Analyte(s)

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes No (N/A)

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability

9. Field duplicate collected? Yes (No)

If Yes:

Parent Sample	Field Duplicate

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

Yes No (N/A)

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes (No) N/A

If Yes:

Four Corners CCR Data Review

Laboratory Name:	Eurofins Environment Testing		
Sample Delivery Group:	J210426	**Review Date:**	12/8/2023
Validator's Name:	Caitlin Riechmann	**Reviewed By:**	Marie Bevier

Sample Summary:

Field Sample Identification	Collection Date and Time	Laboratory Sample Identification	Notes
FC-CCR-MW62-1123	11/06/23 11:27	550-210426-1	
FC-CCR-MW63-1123	11/06/23 12:35	550-210426-2	
FC-CCR-MW64-1123	11/06/23 13:29	550-210426-3	
FC-CCR-MW65-1123	11/06/23 14:34	550-210426-4	

Analytical Methods:

Analyte	Analyte Group	Method
Chloride, Fluoride, Sulfate	Anions	EPA 300.0
Beryllium, Boron, Calcium, Iron, Lithium, Magnesium, Manganese, Potassium, Sodium	Metals	EPA 200.7
Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Selenium, Thallium	Metals	EPA 200.8
Mercury	Metals	EPA 245.1
Alkalinity	General Chemistry	SM 2320B
Total Dissolved Solids (TDS)	General Chemistry	SM 2540C
pH	General Chemistry	SM 4500 H+B

Qualifier Definitions:

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete? (Yes) No

If No, provide details.

Sample Login Matched COC? (Yes) No

If no, provide details.

Sample receipt temperature ≤ 6°C? (Yes) No N/A

If no, provide details.

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

   (Yes) No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

   (Yes) No N/A

3. Samples Analyzed for alkalinity within 14 days of sampling? (Yes) No N/A

4. Samples analyzed for total dissolved solids within 7 days of sampling?

   (Yes) No N/A

5. Samples analyzed for pH within 15 minutes of sampling? Yes (No) N/A

If No:

Sample ID	Analysis	Time Between Collection and Analysis	Effect on Data Usability
FC-CCR-MW62-1123	pH	9 days, 2 hours, 4 minutes	J-HT
FC-CCR-MW63-1123	pH	9 days, 0 hours, 58 minutes	J-HT
FC-CCR-MW64-1123	pH	9 days, 0 hours, 5 minutes	J-HT
FC-CCR-MW65-1123	pH	8 days, 23 hours, 1 minute	J-HT

Note:
HT = Maximum recommended hold time was exceeded.

6. Target analytes detected in the blanks? Yes (No) N/A

If Yes:

Detected Analyte	Concentration	Samples with concentrations less than 5 times the blank detection	Effect on Data Usability

7. LCS recoveries within laboratory-specified limits? Yes (No) N/A

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability
Barium	145%, LCS	85-115%	FC-CCR-MW62-1123, FC-CCR-MW63-1123, FC-CCR-MW64-1123, FC-CCR-MW65-1123	J-HL
Barium	23% RPD	20%	FC-CCR-MW62-1123, FC-CCR-MW63-1123, FC-CCR-MW64-1123, FC-CCR-MW65-1123	J-HD
Boron	116%, LCS	85-115%	FC-CCR-MW62-1123, FC-CCR-MW63-1123, FC-CCR-MW64-1123, FC-CCR-MW65-1123	J-HL
Calcium	117%, LCS	85-115%	FC-CCR-MW62-1123, FC-CCR-MW63-1123, FC-CCR-MW64-1123, FC-CCR-MW65-1123	J-HL
Iron	118%, 116%	85-115%	FC-CCR-MW62-1123, FC-CCR-MW63-1123, FC-CCR-MW64-1123	J-HL
Beryllium	117%, 117%	85-115%	None	NA
Lead	126%, 119%	85-115%	None	NA

Notes:
HD = Imprecision between LCS and LCSD recoveries.
HL = High LCS recovery.
NA = Not applicable.

8. MS performed on a project-specific sample? Yes (No) N/A

If Yes:

Spiked Sample ID	Spiked Analyte(s)

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes No (N/A)

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability

9. Field duplicate collected? Yes (No)

If Yes:

Parent Sample	Field Duplicate

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

Yes No (N/A)

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

(Yes) No N/A

If Yes:

Sample ID	Analysis
FC-CCR-MW62-1123	pH

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

(Yes) No N/A

If No:

Sample ID	Analyte	Effect on Data Usability

11. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

Yes (No)

If No:

Sample ID	Analysis	Time Between Collection and Analysis	Effect on Data Usability
FC-CCR-MW61-1123	pH	6 days, 0 hours, 56 minutes	J-HT
FC-CCR-MW75-1123	pH	6 days, 22 hours, 9 minutes	J-HT

Note:
HT = Maximum recommended hold time was exceeded.

6. Target analytes detected in the blanks? Yes (No) N/A

If Yes:

Detected Analyte	Concentration	Samples with concentrations less than 5 times the blank detection	Effect on Data Usability

7. LCS recoveries within laboratory-specified limits? Yes (No) N/A

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability
Beryllium	117%, 117%	85-115%	None	NA
Boron	116%, LCS	85-115%	FC-CCR-MW52-1123, FC-CCR-MW61-1123, FC-CCR-MW75-1123, FC-CCR-FD03-1123	J-HL
Calcium	117%, LCS	85-115%	FC-CCR-MW61-1123, FC-CCR-MW75-1123	J-HL

Note:
HL = High LCS recovery.
NA = Not applicable.

8. MS performed on a project-specific sample? (Yes) No N/A

If Yes:

Spiked Sample ID	Spiked Analyte(s)
FC-CCR-MW52-1123	Boron, Cobalt, Molybdenum

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes (No) N/A

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability
FC-CCR-MW52-1123	Boron	56%, 52%	70-130%	NA4

Note:
NA4 = The concentration detected in the unspiked native sample is more than four times the spike concentration and it is not possible to assess data usability based on the MS recovery.

9. Field duplicate collected? (Yes) No

If Yes:

Parent Sample	Field Duplicate
FC-CCR-MW52-1123	FC-CCR-FD03-1123

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

(Yes) No N/A

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

(Yes) No N/A

If Yes:

Sample ID	Analysis
FC-CCR-MW61-1123	pH

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

(Yes) No N/A

If No:

Sample ID	Analyte	Effect on Data Usability

11. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

Yes (circled) No

If No:

Analyte	Recovery	QC Limits	Affected Samples	Effect on Data Usability
Iron	123%, LCS	85-115%	FC-CCR-MW57-1123	J-HL
Iron	120%, LCS	85-115%	FC-CCR-MW06R-1123	J-HL
Sodium	117%, LCS	85-115%	FC-CCR-DMX03-1123, FC-CCR-MW18-1123, FC-CCR-MW23R-1123, FC-CCR-MW24-1123, FC-CCR-MW36R-1123, FC-CCR-MW38R-1123, FC-CCR-MW56-1123, FC-CCR-MW57-1123, FC-CCR-MW82S-1123 FC-CCR-FD02-1123	J-HL
Beryllium	118%, 116%	85-115%	None	NA
Beryllium	122%, 116%	85-115%	None	NA

Notes:
HL = High LCS recovery.
NA = Not applicable.

8. MS performed on a project-specific sample? (Yes) No N/A

If Yes:

Spiked Sample ID	Spiked Analyte(s)
FC-CCR-MW30-1123	Boron, Cobalt, Molybdenum
FC-CCR-DMX01-1123	Boron, Cobalt, Molybdenum
FC-CCR-MW81-1123	Boron, Cobalt, Molybdenum
FC-CCR-MW18-1123	Lithium

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes (No) N/A

If No:

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability
FC-CCR-MW81-1123 (FC-CCR-FD07-1123)	Boron	196% RPD	20%	J-HD
FC-CCR-MW81-1123 (FC-CCR-FD07-1123)	Boron	-4,972%, -136%	70-130%	J-PJ
FC-CCR-MW30-1123 (FC-CCR-FD06-1123)	Boron	-2,012%, -2,008%	70-130%	J-PJ

Sample ID	Analyte	RPD or Recovery	Accuracy or Recovery Limits	Effect on Data Usability
FC-CCR-DMX01-1123 (FC-CCR-FD04-1123)	Boron	-801%, -187%	70-130%	NA4

Notes:
HD = Imprecision between MS and MSD results.
NA4 = The concentration detected in the unspiked native sample is more than four times the spike concentration and it is not possible to assess data usability based on the MS recovery.
PJ = Professional judgement. Though the spike concentration is too low to assess accuracy based on MS recovery, the concentration detected in the MS and/or MSD is significantly lower than the concentration detected in the unspiked native sample.

9. Field duplicate collected? (Yes) No

If Yes:

Parent Sample	Field Duplicate
FC-CCR-MW82S-1123	FC-CCR-FD02-1123
FC-CCR-DMX01-1123	FC-CCR-FD04-1123
FC-CCR-MW19-1123	FC-CCR-FD05-1123
FC-CCR-MW30-1123	FC-CCR-FD06-1123
FC-CCR-MW81-1123	FC-CCR-FD07-1123

b. Are RPDs between primary and duplicate results ≤ 20% or are differences between analyte concentrations ≤ the reporting limit?

(Yes) No N/A

If No:

Primary Sample ID	Duplicate Sample ID	Analyte	RPD	Effect on Data Usability

10. Did the laboratory perform duplicate analyses on project-specific samples?

(Yes) No N/A

If Yes:

Sample ID	Analysis
FC-CCR-MW06R-1123	Alkalinity
FC-CCR-MW36R-1123	TDS
FC-CCR-MW38R-1123	pH

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes (circled) No N/A

If No:

Sample ID	Analyte	Effect on Data Usability

11. Are non-detect results sufficiently low to meet EPA primary drinking water criteria?

Yes No (circled)

Analytical Methods:

Analyte	Analyte Group	Method
Chloride, Fluoride, Sulfate	Anions	EPA 300.0
Beryllium, Boron, Calcium, Iron, Lithium, Magnesium, Manganese, Potassium, Sodium	Metals	EPA 200.7
Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Manganese, Molybdenum, Selenium, Thallium, Zinc	Metals	EPA 200.8
Mercury	Metals	EPA 245.1
Alkalinity	General Chemistry	SM 2320B
Total Dissolved Solids (TDS)	General Chemistry	SM 2540C
pH	General Chemistry	SM 4500 H+B

Qualifier Definitions:

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete? (Yes) No

If No, provide details.

Sample Login Matched COC? (Yes) No

If no, provide details.

Sample receipt temperature ≤ 6°C? (Yes) No N/A

If no, provide details.

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

   (Yes) No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

   (Yes) No N/A

3. Samples Analyzed for alkalinity within 14 days of sampling? (Yes) No N/A

4. Samples analyzed for total dissolved solids within 7 days of sampling?

   Yes (No) N/A

5. Samples analyzed for pH within 15 minutes of sampling? Yes (No) N/A

If No:

Sample ID	Analysis	Time Between Collection and Analysis	Effect on Data Usability
FC-CCR-DMX06-1123	pH	14 days, 3 hours, 25 minutes	J-HT
FC-CCR-MW11-1123	pH	13 days, 21 hours, 14 minutes	J-HT

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

< = less than
BTV = Background Threshold Value
CCR = Coal Combustion Residual
degrees C = degrees Celsius
GWPS = Groundwater Protection Standard
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units
UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

< = less than
BTV = Background Threshold Value
CCR = Coal Combustion Residual
degrees C = degrees Celsius
GWPS = Groundwater Protection Standard
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units
UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

< = less than
BTV = Background Threshold Value
CCR = Coal Combustion Residual
degrees C = degrees Celsius
GWPS = Groundwater Protection Standard
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units
UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

* data appears anomalous
< = less than
BTV = Background Threshold Value
CCR = Coal Combustion Residual
degrees C = degrees Celsius
GWPS = Groundwater Protection Standard
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units
UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

* data appears anomalous
< = less than
BTV = Background Threshold Value
CCR = Coal Combustion Residual
degrees C = degrees Celsius
GWPS = Groundwater Protection Standard
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units
UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

* data appears anomalous
< = less than
BTV = Background Threshold Value
CCR = Coal Combustion Residual
degrees C = degrees Celsius
GWPS = Groundwater Protection Standard
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units
UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Table F-7
Groundwater Sampling Results for the CWTP Monitoring Wells - Appendix III Constituents

					Appendix III Constituents							
				Constituent:	Boron	Calcium	Chloride	Fluoride	pH (Field Measurement)	pH (Laboratory Measurement)	Sulfate	Total Dissolved Solids
				Filtered:	N	N	N	N	N	N	N	N
				Units:	mg/L	mg/L	mg/L	mg/L	su	su	mg/L	mg/L
				CWTP BTV (applicable to MW-62)	*2*	*536*	*631*	*1.8*	*6.5 - 6.9*	*6.5 - 6.9*	*13,000*	*20,000*
				CWTP BTV (applicable to MW-63)	*2*	*536*	*631*	*2.3*	*6.5 - 6.9*	*6.5 - 6.9*	*13,000*	*20,000*
				CWTP BTV (applicable to MW-64)	*0.73*	*486*	*631*	*1.6*	*7.23 - 7.66*	*7.23 - 7.66*	*13,000*	*20,000*
				CWTP BTV (applicable to MW-65)	*0.73*	*486*	*631*	*2.1*	*7.00 - 7.44*	*7.00 - 7.44*	*13,000*	*20,000*

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

< = less than

BTV = Background Threshold Value

CCR = Coal Combustion Residual

ID = Identification

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

mg/L = milligrams per liter

NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.

pCi/L = Picocuries per liter

su = standard units

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

< = less than
BTV = Background Threshold Value
CCR = Coal Combustion Residual
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
mg/L = milligrams per liter
NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
pCi/L = Picocuries per liter
su = standard units

Table F-9
Groundwater Sampling Results for the CWTP Monitoring Wells - Additional Analyses

BTV exceedances are shown in grey shaded cells. GWPS exceedence are shown in red text.

Abbreviations and Data Qualifiers:

< = less than

BTV = Background Threshold Value

CCR = Coal Combustion Residual

ID = Identification

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

mg/L = milligrams per liter

NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.

pCi/L = Picocuries per liter

su = standard units

Abbreviations and Data Qualifiers:

< = less than
CCR = Coal Combustion Residual
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units

Table F-12
Groundwater Sampling Results for the CWTP Surface Water Samples - Additional Analyses

					Additional Analyses

Abbreviations and Data Qualifiers:
< = less than
CCR = Coal Combustion Residual
ID = Identification
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
mg/L = milligrams per liter
pCi/L = Picocuries per liter
su = standard units

Abbreviations and Data Qualifiers:

*data appear anomalous

< = less than

CCR = Coal Combustion Residual

degrees C = degrees Celsius

ID = Identification

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

mg/L = milligrams per liter

pCi/L = Picocuries per liter

su = standard units

CCR GROUNDWATER ASSESSMENT MONITORING STATISTICAL ANALYSIS AND RESULTS FOR THE CWTP APPENDIX IV CONSTITUENT DATA COLLECTED THROUGH JUNE 2023

TECHNICAL MEMORANDUM

To:	Arizona Public Service Company	Project No.	14-2023-2011
By:	Samantha O'Shea	Reviewed by:	Maren Henley, PE
Tel:	602-733-6000	CC:	File
Date:	October 09, 2023		

Re: CCR GROUNDWATER ASSESSMENT MONITORING
STATISTICAL ANALYSIS AND RESULTS FOR THE CWTP
APPENDIX IV CONSTITUENT DATA COLLECTED THROUGH JUNE 2023
Arizona Public Service Company Four Corners Power Plant – Fruitland, New Mexico

1.0 INTRODUCTION

This Technical Memorandum presents the results of a statistical evaluation of groundwater monitoring data collected from monitoring wells downgradient of the Combined Waste Treatment Pond (CWTP) located at the Arizona Public Service Company (APS) Four Corners Power Plant (Site) in Fruitland, New Mexico. The statistical evaluation was performed by Geosciences Consulting Strategies, LLC (Geosciences Consulting), a subcontractor to WSP USA Environment and Infrastructure, Inc. (WSP) pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (CCR Rule) (Federal Register, 2020).

The statistical analysis documented herein presents an initial evaluation of assessment monitoring (i.e., Appendix IV constituent) groundwater data collected from the CWTP to date. Statistically significant increases (SSIs) over background concentrations were declared on April 10, 2023 at CWTP monitoring well, MW-62 for two detection monitoring constituents (boron and calcium). CWTP downgradient compliance wells include MW-62, MW-63, MW-64, and MW-65 and CWTP background wells include MW-71, MW-72, and MW-73 during the May 2023 semi-annual sampling event and a June 2023 assessment monitoring sampling event.

2.0 STATISTICAL EVALUATION RESULTS

Attachment A presents the initial statistical evaluation of Appendix IV constituents performed by Geosciences Consulting. The results of the evaluation are summarized as follows:

- Table 1 of Attachment A summarizes the groundwater protection standard (GWPS) selection for each Appendix IV constituent. Table 2 of Attachment A summarizes the lower confidence level (LCL) value for each constituent in each well, if the LCL value exceeds its respective GWPS, statistically significant temporal trends, and the type of LCL test applied.
- This statistical evaluation indicates there is insufficient evidence to declare statistically significant levels (SSLs) in Appendix IV constituent concentrations above respective GWPSs at the CWTP.

WSP USA Environment & Infrastructure Inc.
4600 East Washington Street, Suite 600
Phoenix, Arizona 85034
T: +1 602-733-6000
wsp.com1

- Several compliance monitoring wells exhibit statistically significant ($p < 0.05$) temporal trends as follows:
    - Increasing temporal trends were noted at downgradient wells MW-62 for arsenic and total radium and at MW-65 for barium and cobalt.
    - Decreasing temporal trends were noted at downgradient wells MW-62 for barium and molybdenum, MW-63 for cobalt, MW-64 for barium and fluoride, and MW-65 for fluoride.
- The analysis suggests spatial heterogeneity is present for the grouped background wells (MW-71, MW-72 and MW-73) for multiple Appendix IV constituents, including arsenic, barium, cadmium, cobalt, lithium, molybdenum, total radium, selenium and thallium. Additional assessment is warranted to confirm adequacy and representativeness of background well designations for the CWTP.

3.0 RECOMMENDATIONS

Pursuant to the CCR Rule, the SSI declaration made in April 2023 triggers either initiation into the assessment monitoring program or performing a successful Alternative Source Demonstration (ASD) to the CWTP as cause of the Appendix III constituent exceedances above the BTVs. There are currently no SSLs for Appendix IV constituents above their respective GWPSs.

Based on the statistical evaluation presented in Attachment A and pursuant to the CCR Rule, the CWTP should remain in assessment monitoring until criteria under §257.95(e) of the CCR Rule are met (Federal Register, 2020). WSP recommends performing continued trend testing after each monitoring event and updates to the BTVs after 1-2 years of future sampling events.

Date: October 09, 2023

Subject: CCR Groundwater Assessment Monitoring
Statistical Evaluation of CWTP Data through June 2023
Arizona Public Service Company Four Corners Power Plant – Fruitland, New Mexico

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) documents the statistical evaluation of assessment monitoring (i.e., Appendix IV constituents) groundwater data associated with the Combined Waste Treatment Pond (CWTP) unit located at the Arizona Public Service Company (APS) Four Corners Power Plant (FCPP) in Fruitland, New Mexico. This statistical evaluation is completed by Geoscience Consulting Strategies LLC in accordance with the Statistical Data Analysis Work Plan (SDAWP) for the FCPP and the Coal Combustion Residuals (CCR) Rule (Federal Register, 2020; WSP USA Environment & Infrastructure Inc (WSP), 2023).

On 10 April 2023 APS declared a statistically significant increase for two detection monitoring (i.e., Appendix III) constituents (boron and calcium) at the CWTP. Per the CCR Rule, within 90 days of this declaration APS initiated an assessment monitoring program for the CWTP.

The statistical methods and analysis herein includes updates to the groundwater protection standards (GWPSs) for Appendix IV constituents at the FCPP using either: 1) statistically-driven background threshold values (BTVs), 2) the applicable U.S. Environmental Protection Agency (EPA) Maximum Contaminant Level (MCL) promulgated under the Safe Drinking Water Act, or 3) alternative risk-based GWPSs established in the statute, whichever is higher (40 Code of Federal Regulations [CFR] Section [§] 257.95(h)).

The following sections detail data inputs, methods, results and recommendations for the subject statistical evaluation.

2.0 DATA INPUTS

The CWTP groundwater monitoring well network consists of three background monitoring wells (MW-71, MW-72, and MW-73) and four compliance (i.e., downgradient) monitoring wells (MW-62, MW-63, MW-64 and MW-65). The period of evaluation for the CWTP Appendix IV constituent statistical analysis ranges from November 2015 through June 2023 and includes the minimum of eight initial, or baseline, sampling rounds required by the CCR Rule and six subsequent sampling rounds of for Appendix IV groundwater constituents that occur on a semi-annual frequency, as shown in the table below.

CWTP Appendix IV Sampling Round	Date
1st	October 2017
2nd	April 2021
3rd	November 2021
4th	May 2022
5th	November 2022
6th	May/June 2023

Appendix A contains the sample data for the subject analysis. Due principally to the CCR Rule requirement that a minimum of eight initial rounds of data be collected from the site prior to October 17, 2017, the frequency of sample collection prior to this date is short and variable (e.g., biweekly to quarterly sampling). The duration is shorter (i.e. February 2017 through June 2018) for MW-73, which was installed in January 2017.

Depending on the Appendix IV constituent, the minimal sample numbers in this statistical evaluation ranges between 19 to 31 for compliance wells and 67 to 80 for pooled background monitoring wells.

Data inputs for this statistical analysis were prepared, and provided by, WSP. As shown in Appendix A, the Appendix IV analytes are listed by name or chemical symbol as column headers as required by the statistical software (i.e., ProUCL). By convention, each analyte has a corresponding data column (indicated with a "D_" prefix) that indicates if the analyte was detected or not at a concentration that exceeds the analytical reporting limit, where detectable concentrations are symbolized by a "1" and non-detectable concentrations are symbolized by a "0."

3.0 METHODS

The assessment monitoring statistical evaluation implements a single-sample population testing approach, where downgradient samples are compared to a pre-defined standard, in this case the GWPS. This is a fundamental distinction from the detection monitoring statistical evaluation. As such, the statistical methods and testing approaches differ between detection monitoring and assessment monitoring.

To establish current GWPSs for the CWTP, updates to the FCPP Appendix IV BTVs are necessary. In accordance with the Unified Guidance (U.S. EPA, 2009) and CCR Rule (40 C.F.R. § 257.93(f)(3)), the Statistical Data Analysis Work Plan (WSP, 2023) identifies the upper tolerance limit (UTL) method as the prescribed approach for establishing BTVs for assessment monitoring. The advantage of selecting the UTL method is its ability to serve as a single-sample statistical comparison. The statistical hypothesis structure for a single-sample comparison is reversible, such that the same fixed background level can be used for assessment monitoring and later for corrective action comparison testing, if necessary. The UTL tests are applicable for analytes that exhibit non-detectable frequencies of less than 100%.

The U.S. EPA's Unified Guidance (2009) and the Statistical Data Analysis Work Plan (WSP, 2023) promotes the use of the Double Quantification Rule (DQR) to calculate the UTL in cases where the background non-detection frequency is equal to 100%.

To determine CWTP compliance under assessment monitoring, the Appendix IV sample data from downgradient compliance wells are statistically compared to respective GWPSs using confidence intervals. Confidence intervals encompasses a variety of statistical tests (U.S. EPA, 2009). For assessment monitoring, the lower confidence limit (LCL) for each Appendix IV constituent is compared to its respective GWPS to assess if the lower limit exceeds the GWPS and, if so, declares a statistically significant level (SSL) in constituent concentrations above the GWPS.

Each compliance well analyte underwent exploratory data analysis (EDA) (see Section 3.2) to ensure that the compliance well had no sample outliers and to assess for statistically significant ($p<0.05$) increasing or decreasing temporal trends in the sample data. The EDA process also identified which statistical distribution the sample data best fit to select an appropriate statistical comparison (e.g. parametric versus non-parametric) to the GWPS (WSP, 2023).

The following section describe the above statistical methods in more detail.

3.1 Exploratory Data Analysis Workflow Procedures

EDA is a data diagnostic step that generates qualitative and quantitative information necessary to select a defensible statistical method to determine if there is a SSL over the GWPS. Figure 1 generalizes the EDA workflow, including assessment of spatial heterogeneity, trend detection, data distribution assessment, and outlier detection. Sample number, monitoring well network configuration, sampling frequency and non-detect frequency determine which EDA methods are most useful. The final EDA step is selecting an adequate and appropriate statistical method. Notably, the EDA workflow procedure is standard between detection monitoring and assessment monitoring.

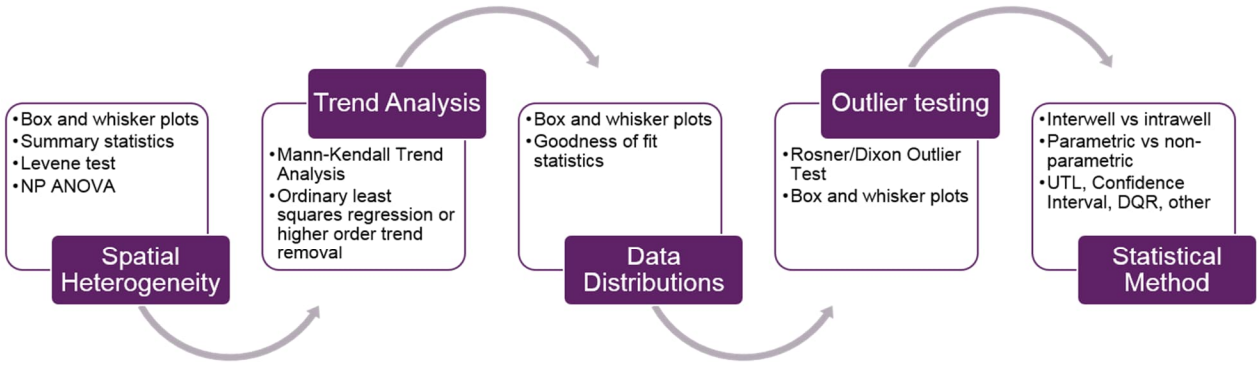

Figure 1. Assessment monitoring EDA and statistical method workflow procedures. Each box represent as separate step in the EDA workflow process. The items listed in each box identifies the statistical method(s) applied for each step. Both quantitative and qualitative methods are listed.

There are a number of different types of tolerance limit and confidence interval quantification methods to select from, depending on the statistical distribution, the presence of a temporal trend, the type of statistical comparison (e.g. interwell or intrawell) and the quantity of non-detect values in the background sample data. The following subsections describe these methods and criteria for their selection.

Appendix B summarizes the results of the EDA of CWTP Appendix IV groundwater data. Non-detect values can introduce subjective uncertainty into the trend analysis, mainly through changes in the reporting limits over time since they are often substituted as the sample analytical value. To avoid this subjective uncertainty, constituents with a non-detect frequency greater than 50% were excluded from the trend analysis.

3.2 Establishing Background Threshold Values

As stated in Section 1.0, BTVs can serve as the GWPS, if appropriate. For this reason, the BTVs were updated as part of this statistical evaluation. Three UTL statistical tests are applicable for updating BTVs for Appendix IV constituents at FCPP: the parametric interwell upper tolerance limit, non-parametric interwell upper tolerance limit and the Double Quantification Rule. This work assumes that background well locations are adequate and thereby declare interwell comparisons appropriate. Each statistical test is described below.

3.2.1 Parametric Interwell Upper Tolerance Limit (P-UTL)

An interwell UTL represents an upper boundary, or threshold concentration value, that contains a pre-specified proportion, or coverage, of the underlying groundwater statistical population. For example, this coverage can range from 95% to 99% of all possible sample measurements in the underlying background statistical population, depending on the data characteristics. Because the monitoring program cannot sample everywhere, there is inherent uncertainty in defining the true underlying statistical population. For this reason, statistical confidence in this coverage is incorporated into the UTL equation using a tolerance coefficient (U.S. EPA, 2009). Oftentimes a tolerance coefficient of at least 95% is used, which corresponds to a significance level (α) equal to 5% (U.S. EPA, 2009). Table 17-3 within the Unified Guidance (U.S. EPA, 2009) combines the coverage and confidence to calculate the UTL.

A parametric interwell upper tolerance limit (P-UTL) is an adequate method if the background sample data generally met the following criteria, which are tested using procedures declared in the Statistical Data Analysis Work Plan (Wood, 2018):

1. Temporal stationarity (no trend in concentration through time)
2. Normal or transformed normal data distribution
3. Spatial heterogeneity is minimal
4. Sample outliers have been removed
5. Sample data are statistically independent and identically distributed

The P-UTLs were calculated using a 99% coverage with a 95% confidence. Although the Unified Guidance (U.S. EPA, 2009) recommends at least a 95% coverage, the 99% coverage is justifiable for the following reasons:

1. The sampling frequency for the November 2015 to June 2018 sampling period is higher than quarterly in some cases, suggesting the background sample data might not be independent samples and might underrepresent long-term temporal variations in groundwater constituent concentrations. A larger coverage can help compensate for underrepresented temporal variation. A more conservative coverage (i.e. only 95%) is suggested once a longer history of samples exists and the background sampling frequency becomes more consistent (e.g., semiannual).

2. Spatial heterogeneity is suspected at the CWTP. Spatial heterogeneity introduces uncertainty in the sample data in that one sample location might have naturally occurring elevated concentrations of a constituent relative to other sample locations. This uncertainty can increase the chance of a declaring a false positive SSL. By increasing the UTL coverage it is possible to reduce the chance of declaring a false positive SSL due to spatial heterogeneity. This analysis assumes that the background well designations are adequate such that the other extreme does not occur (i.e., that the spatial heterogeneity causes background analyte concentrations to be elevated and result in a false negative SSL downgradient of the site).

The UTL coverage assumes the background sample data set is adequate and representative of intrinsic spatial and temporal variability in groundwater constituent concentrations beneath the CWTP for Appendix IV constituents. Factors that can violate this assumption include: 1) background wells completed in a different water-bearing unit than compliance wells (i.e., spatial heterogeneity), 2) background wells that have not been sampled during times of extreme potentiometric level (e.g., drought, etc.), and 3) structurally-compromised wells that do not produce representative groundwater samples. Reference to the conceptual site model and professional judgement/interpretation are necessary to confirm the adequacy of background well designations for this statistical evaluation.

Table 1 lists background analytes and wells that are subject to the P-UTL method.

3.2.2 Non-Parametric Interwell Upper Tolerance Limit (NP-UTL)

A non-parametric interwell tolerance limit (NP-UTL) was calculated if the upgradient sample data generally met the following diagnostic criteria:

1. Temporal stationarity
2. No discernable data distribution
3. Spatial heterogeneity is minimal
4. Sample outliers have been removed
5. Statistical independence

Criterion Number 2, where a parametric distribution is not discernable from the sample data, primarily drives the NP-UTL selection. A NP-UTL uses the first or second highest-ranked background concentration value to establish the UTL, depending on the number of data points. “Ranked” means the grouped background concentration values are ordered in decreasing order and assigned a rank based on this order, where a rank equal to one represents the maximum concentration value. Table 17-4 in the Unified Guidance (U.S. EPA, 2009) provides minimum coverage levels for the first and second ordered sample values with 95% confidence for different background sample numbers. Table 17-4 illustrates that the sample number controls the coverage for the NP-UTL and higher sample numbers are necessary to achieve a higher coverage. Overall, the non-parametric tolerance limit is less powerful in comparison to its parametric counterparts (but more appropriate when parametric assumptions are not met).

The NP-UTL uses the maximum ranked value in the background well, which can constitute a reporting limit value if the reporting limit is higher than detectable concentrations.

Table 1 lists background analytes and wells that are subject to the NP-UTL method.

3.2.3 Double Quantification Rule

The DQR is appropriate when the analyte exhibits 100% non-detectable concentrations in the background data set. The DQR states that, for any given compliance well analyte, two consecutive detectable concentrations that are above the maximum reporting limit are sufficient evidence to declare an SSL.

It should be noted that implications exist when there are inconsistencies in reporting limit values over time and between monitoring wells. For example, when the downgradient wells reflect a higher maximum reporting limit in comparison to the background well, applying the DQR leads to uncertainty in identifying a real SSL (i.e., the statistical test results in a false negative SSL). In other cases, it is possible to have lower reporting limit values in downgradient wells, resulting in higher detections, which can trigger a false positive SSL. For these reasons, it is highly recommended that the laboratory establish achievable and consistent analytical reporting limit values among all wells throughout the duration of the monitoring program.

Table 1 lists background analytes and wells that subject to the DQR.

3.3 Establishing Compliance Well Comparison Limits

Assessment monitoring, unlike detection monitoring, does not compare individual sample observations to a GWPS. Rather, for any given constituent, the entire sample population for an Appendix IV constituent within a compliance well is taken into consideration when making a comparison to its respective GWPS. In this case, the central tendency of the sample population is the parameter of interest, consisting of the mean or median. Since the groundwater program cannot sample everywhere all the time, there is uncertainty as to where the true central tendency sits for any given sampled groundwater constituent. As such, it is adequate to establish a confidence limit around the sample population's central tendency with an acceptable margin of error, typically 5%, which corresponds to a 95% confidence interval. Both of these statistical parameters are discussed in more detail below.

Confidence intervals are a recommended approach for comparing compliance well (i.e., downgradient) data to a GWPS during assessment monitoring or corrective action (U.S. EPA, 2009). The confidence interval accounts for both the level of statistical variation in the data and the desired confidence level. For this statistical analysis, the lower confidence limit is of interest and reflects the lowest concentration beyond which we do not expect the true central tendency of the downgradient sample data to reside.

Below is the formal null hypothesis statement for the confidence limit:

Ho: The true central tendency of the sample concentrations at the compliance point (e.g. downgradient well) is no greater than the predetermined GWPS.

This is the assumed condition unless, through a statistical test, the sample data demonstrate otherwise. The null hypothesis is rejected when the lower confidence limit (LCL) of the compliance sample dataset resides above the GWPS, resulting in sufficient evidence to declare an SSL.

Statistical power describes the sensitivity of a statistical test, or its ability to detect a true increase above the GWPS. The statistical power can be negligible when the sample size is small, the sample variability is high and/or the confidence level is set too high (U.S. EPA, 2009). Statistical confidence should not be confused

with the statistical power. The statistical confidence (1-α) indicates how often the confidence limit will contain the statistical parameter of interest (i.e., mean or median). The significance level (α) describes the error rate, or the rate at which the null hypothesis is rejected when in fact it is true (i.e., the test results in a false positive SSL declaration). Because the statistical power typically decreases with higher confidence levels, the Unified Guidance (U.S. EPA, 2009) recommends first establishing an acceptable level of statistical power and then computing the associated confidence level. The Unified Guidance (U.S. EPA, 2009) suggests that the compliance test have at least 80% statistical power to detect a compliance well central tendency that is two times above the GWPS. This recommendation primarily accommodates parametric statistical tests, meaning when parametric method assumptions are not met, the parametric methods' power and confidence are not meaningful. In these cases, non-parametric methods are appropriate and their confidence limits generally exhibit somewhat less statistical power than their parametric counterparts.

The EDA results for the subject analysis suggest that three LCL statistical tests are appropriate for groundwater data collected downgradient of the URS: the parametric lower confidence limit, non-parametric lower confidence limit and the parametric lower confidence limit with a temporal trend. Each statistical test is described below.

3.3.1 Parametric Lower Confidence Limits (P-LCL)

For parametric data distributions, the mean (i.e., central tendency), standard deviation, and one-tailed Student's t value are necessary to calculate the parametric lower confidence limit (P-LCL) according to Equation 21.1 in the Unified Guidance (U.S. EPA, 2009). The confidence level (1-α) is necessary to establish the Student's t value. The objective is to select the α that achieves high statistical power with an acceptable level of confidence. Table 22-2 in Appendix D of the Unified Guidance (U.S. EPA, 2009) allows for the selection of α based on the compliance well's sample number and the above statistical power criterion (i.e., at least 80%). The selected α for the P-LCL test is the maximum value that achieves at least 80% statistical power for the set sample number (n) and the minimum RCRA standard requirement of $\alpha = 0.01$ (U.S. EPA, 2009).

Table 2 summarizes compliance well analytes subject to the P-LCL test.

3.3.2 Non-Parametric Lower Confidence Limits (NP-LCL)

For the non-parametric cases, the median represents the central tendency. The Unified Guidance (U.S. EPA, 2009) does not provide formal guidance for calculating the statistical power for a non-parametric statistical test using environmental data. As such, the non-parametric confidence limit calculations will achieve a minimum confidence level of 95%.

The non-parametric LCL (NP-LCL) test uses the sample number and the 95% confidence level (1-α) to establish the LCL. The compliance well with a sample count (n) is first ordered from smallest to largest sample concentration then assigned a numeric rank, where 1 is the lowest concentration and (n) is the highest concentration. Table 21-11 in Appendix D of the Unified Guidance (U.S. EPA, 2009) provides achievable confidence levels for ranked values for small sample sizes ($n<20$). The rank value that achieves the 95% confidence level or higher serves as the lower non-parametric confidence limit.

Table 2 summarizes compliance well analytes subject to the NP-LCL test.

3.3.3 Calculating the Trend-Dependent Lower Confidence Limit (P-LCLT)

The confidence interval tests are sensitive to temporal trends, which can inflate the standard deviation. If the temporal Mann-Kendall trend was significant ($p<0.05$), and the data exhibit a parametric distribution, the 95% lower confidence interval was calculated around the temporal trend (P-LCLT). If a trend was significant ($p<0.05$) but the data distribution was non-parametric, then a NP-LCL was calculated. The P-LCLT was calculated in ProUCL 5.1 using equation 10-12 in the ProUCL 5.1.1 Technical Guidance (U.S. EPA, 2015). By proxy, the coefficient of variation was calculated to assess the statistical power of this parametric test. The Unified Guidance (Section 7.4.1) suggests that if the coefficient of variation is less than or equal to 0.5, the lower limit confidence exhibits adequate statistical power.

Table 2 summarizes compliance well analytes subject to the P-LCLT test and Appendix B contains the relevant ProUCL outputs.

4.0 Results

Table 1 summarizes the GWPS selection for each Appendix IV constituent. The GWPS constitutes either: 1) the statistically calculated BTV, 2) the U.S. EPA's promulgated MCL, or 3) the risk-based alternative GWPS identified for constituents without MCLs, whichever value is higher.

Table 2 summarizes: 1) the LCL value for each constituent in each well, 2) which compliance wells exhibit statistically significant temporal trends and 3) the type of LCL test applied.

This statistical evaluation indicates there is insufficient evidence to declare a statistically significant level (SSL) in Appendix IV constituent concentrations above respective GWPSs at the CWTP.

Several compliance monitoring wells exhibit statistically significant ($p<0.05$) temporal trends. Most notable are the statistically significant ($p<0.05$) increasing trends present in more than one compliance well for arsenic, barium, cobalt and combined radium. Statistically significant ($p<0.05$) trends were detected in the background dataset for arsenic (decreasing), barium (decreasing), molybdenum (decreasing) and selenium (decreasing).

This analysis suggests spatial heterogeneity is present for the grouped background wells (MW-71, MW-72 and MW-73) for multiple Appendix IV constituents, including arsenic, barium, cadmium, cobalt, lithium, molybdenum, total radium, selenium and thallium. Reference to the conceptual site model and professional judgement/interpretation are necessary to confirm adequacy and representativeness of background well designations for the CWTP.

5.0 Recommendations

This statistical analysis results in the following recommendations for the CWTP assessment monitoring statistical analysis:

1. The laboratory should achieve reporting limits below the U.S. EPA's promulgated MCLs and maintain a constant reporting limit for each analyte over time for all monitoring wells – background and compliance. This recommendation will improve the certainty of detection of temporal trends

in the groundwater sample data while also decreasing the probability for declaring a false negative or false positive SSLs when applying statistical tests, especially the DQR.

2. Intrawell statistical comparisons should be considered for analytes that exhibit spatial heterogeneity. Reference to the conceptual site model and professional judgement/interpretation are necessary to confirm adequacy and representativeness of background well designations for the CWTP.

3. The CWTP should remain in Assessment Monitoring until criteria under §257.95(e) of the CCR Rule are met.

Data appear Lognormal at (0.05) Significance Level							
Beryllium (mw-62)							
	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs	
Raw Statistics	31	11	20	1	19	95.00%	
Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!							
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).							

Appendix B
Goodness of Fit Statistics

The data set for variable Beryllium (mw-62) was not processed!

Beryllium (mw-63)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	30	10	20	1	19	95.00%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Beryllium (mw-63) was not processed!

Beryllium (mw-64)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	30	10	20	1	19	95.00%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Beryllium (mw-64) was not processed!

Beryllium (mw-65)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	30	10	20	0	20	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Beryllium (mw-65) was not processed!

Lead (mw-73)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	25	6	19	0	19	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Lead (mw-73) was not processed!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Mercury (mw-72) was not processed!

Mercury (mw-73)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	25	6	19	0	19	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Mercury (mw-73) was not processed!

CALIBRATION AND UTILIZATION UPDATE ON THE GROUNDWATER MODEL SUPPORTING URS REMEDY SELECTION

TECHNICAL MEMORANDUM

To:	Arizona Public Service Company 400 N. 5th Street Phoenix, Arizona 85004	**Project No.**	14-2022-2030
By:	Vivek Patil, Ph.D.	**Reviewed by:**	Rebecca Weaver, PE
Date:	August 18, 2023		
Re:	**CALIBRATION AND UTILIZATION UPDATE ON THE GROUNDWATER MODEL FOR THE URS CORRECTIVE MEASURES ASSESSMENT** Four Corners Power Plant – Fruitland, New Mexico		

1 INTRODUCTION

This Technical Memorandum (Tech Memo) has been prepared by WSP USA Environment & Infrastructure, Inc. (WSP) (formerly Wood Environment & Infrastructure Solutions Inc. [Wood E&I]) to document the updated calibration and utilization of a three-dimensional (3-D) groundwater flow and transport model representing near-surface hydrogeologic conditions in the vicinity of the former Upper Retention Sump (URS), a coal combustion residuals (CCR) unit at the Arizona Public Service Company (APS) Four Corners Power Plant in Fruitland, New Mexico (the Site).

The model was developed to serve as a quantitative tool to evaluate potential corrective measures to address the elevated concentrations of fluoride, a CCR Rule constituent observed in the Pictured Cliffs Sandstone hydrostratigraphic unit downgradient from the former URS. The development, calibration and predictive results of the original model are documented in a previous technical memo from 2019 prepared by Wood E&I (Wood 2019). This Tech Memo documents the updates made to the original model, including newer data and information calibration, and the updated model predictions regarding the assessment of the corrective measures being implemented for the URS. Also included are those details of the original model as required to provide a context to the new updates and results.

2 METHODOLOGY

This section describes the building blocks of the model, including approach, computational platform, model structure, model parameters and calibration data.

2.1 MODELING APPROACH

The URS, which was a source of groundwater recharge and fluoride in the underlying sandstone unit, was removed from service and demolished between June and December of 2018. The original model, developed after the URS was closed, was used to simulate the impact of extraction wells on the groundwater surface, pumping rates and placement of extraction wells. The steady state conditions in the original model were calibrated to March 2019 and then a transient solute transport model was developed. The transient solute transport model was used for forecasting the fate and migration of the fluoride plume associated with the URS under 3 different remediation scenarios, consisting of a natural attenuation, a single-well and a two-well extraction system analysis. The original

T: +1 602-733-6000
wsp.com

model predicted that a two-well extraction system would be the most effective (least amount of time) in remediating the fluoride plume.

The updated model described in this Tech Memo was built on the original model. Between March 2019 and current conditions, two extraction wells were installed and became operational in February 2022. In the updated model, steady state was calibrated to conditions prior to February 2022. A transient flow and solute transport run was calibrated for the period of February-November 2022 to the head and concentration data acquired from the monitoring wells in the vicinity of the URS. A second transient predictive flow and transport run was conducted to forecast the fate and migration of the fluoride plume based on the current extraction system.

2.2 MODELING PLATFORM

WSP developed the original model using MODFLOW 2005 (Harbaugh 2017), a standard and widely-used USGS modeling code, with the PCG2 solver. Contaminant transport was simulated using MT3DMS (Zheng 1999) with the finite difference solver, which has the advantage of being mass conservative. The same versions of MODFLOW and MT3DMS were maintained in the updated model described in this report. Groundwater Vistas version 8 was used as a graphical user interface to facilitate modeling and visualization. Calibration of the model parameters using observed data was performed using PEST (Doherty 2010).

MODFLOW is a program that uses the finite difference method to solve a 3-D groundwater flow equation. The groundwater flow equation uses transmissivity (in unconfined aquifers, this is the product of hydraulic conductivity and saturated thickness), volumetric flux of water, and storage to solve for the change in head over time. MODFLOW solves the groundwater flow equation numerically by dividing the model domain into grid cells and calculating the head at the center of each cell. A complete discussion of the equations used in MODFLOW is available in the USGS open-file report 00-92, "MODFLOW-2000, the U.S. Geological Survey Modular Ground-Water Model – User Guide to Modularization Concepts and the Ground-Water Flow Process". MT3DMS is a program for simulating advection, dispersion/diffusion, and chemical reactions of contaminants in groundwater flow systems under general hydrogeologic conditions. The advection-dispersion equation uses porosity, dispersivity, and groundwater velocity to solve for the change in concentration over time. MT3DMS solves the advection-dispersion equation numerically using the groundwater flow field from the MODFLOW simulation and a finer discretization of time than what is used in the groundwater flow model to calculate the concentration in the center of each cell at each time step.

Groundwater Vistas (Environmental Simulations, Inc. 2020) is a proprietary graphical user interface that facilitates the modeling process by generating the input files required by MODFLOW 2005 and MT3DMS, and by displaying the modeling environment graphically. While this software is not required to run the model, the pre- and post-processing tools within this software package allow flow and transport models to be quickly constructed, run, and processed for evaluation. Additional tools for processing and visualizing model input and output data include Microsoft Excel and ArcGIS Pro.

2.3 MODEL STRUCTURE

2.3.1 DOMAIN AND GRID DISCRETIZATION

The domain size (0.8 square miles), grid discretization (154 rows, 127 columns), grid orientation (33 degrees from N) and depth discretization (single layer) of the updated model were maintained identical to the original model (**Figure 1**). These details are provided in the memo that documents the original model (Wood 2019).

2.3.2 MODEL BOUNDARIES

The boundary types in the updated model are retained from the original model as the same type and locations. The north boundary was set as constant head type and the other three boundaries were set as general head types. The

head values for these boundaries may involve some uncertainty due to limited hydrogeologic information for the area within these boundaries.

One data gap in estimating the boundary types is that the average observed water level elevation of the Morgan Lake (which is assumed to be constraining the constant head boundary to the North) in the month of November 2021 was 5326.35 feet above sea level (ft asl). However, several of the monitoring wells immediately upgradient to the lake have head values consistently above 5329 ft asl (**Figure 2**). Relative to the overall head gradient across the North-South boundary of the model domain, this sudden drop of almost 4 ft is due to some poorly understood hydrogeologic phenomena that are causing this anomalous head gradient. Using the actual lake level as the head value of the constant head boundary produced highly unrealistic model output that was not possible to improve by any amount of calibration attempts. Hence, in this model, the constant head boundary was assumed to be close to the head values observed in the number of monitoring wells (e.g., MW-83, MW-63, MW-64, etc.) adjacent to the boundary. A head value of 5329 ft asl for the northern constant head boundary produced realistic results (based on the observation data from the monitoring well) and was employed throughout the suite of simulations presented here.

Similarly, the general head boundary values representing the east, west and south boundaries of the model are ambiguous to a certain extent owing to lack of data in the region. Typically, general head boundaries are used to represent physically known constant head boundaries (e.g., streams, lakes, etc.) that are situated outside the model domain at a certain distance from the boundary. However, there are no such features noted in the documentation of the original model that were used to assign the general head boundaries. Those values were instead calibrated based on heads from nearby wells such that they produced realistic model output.

For the purposes of this model update, it was decided to continue with the usage of the general head boundaries from the original model and use the model calibration as a tool to produce model output realistically close to the actual field data. The general heads were uniformly adjusted and manually calibrated until a realistic output was achieved. Reducing the heads of the general head boundary cells by 1 ft. delivered acceptable model calibration.

2.3.3 MODEL PROPERTIES

Model properties are intrinsic hydrogeologic properties of the aquifer system that determine the flow output predicted by the model.

HYDRAULIC CONDUCTIVITY

The hydraulic conductivity (K) values were assigned in the original model in zones based on pumping tests, slug tests and values typical for similar sandstone formations from literature. Horizontal hydraulic conductivity was assumed to be isotropic (Kx = Ky) and vertical hydraulic conductivity was assumed to be an order of magnitude lower than the horizontal (Kz = 0.1 Kx, Ky) as is typical in clean sandstone units. The range of Kx values achieved after calibration in the original model was 1 to 6 ft/d. However, pumping tests conducted in 2020 at extraction wells CM-01, CM-02 suggested higher K values in the range of 20-60 ft/d (Wood 2021). Therefore, in the updated model, the Kx, Ky values were recalibrated using PEST within a user specified range of 1-60 ft/d. The resulting horizontal K field is shown in **Figure 3**. The model was insensitive to changes in vertical K values and the final Kz field was assigned to be 0.1 times the resulting Kx, Ky field. Once the calibrated K values were assigned to the model in the steady state run, these values were carried forward unchanged during the transient runs and calibrations, as hydraulic conductivity is not expected to change over the time of the simulations.

STORAGE PROPERTIES

The transient flow simulations require additional storage properties to be assigned for the aquifer. Initial values assigned for specific storage (Ss), specific yield (Sy) and porosity and their respective user specified ranges for

calibration were adopted from literature (Freeze 1979) and are provided in **Table 1**. Porosity remained unchanged after the transient flow calibrations.

SOLUTE TRANSPORT PROPERTIES

Given the timeframe of the model and the geochemical environment of the system, the contaminant transport of fluoride was assumed to be conservative (non-adsorbing and non-reactive). Therefore, the only required parameter specific to the solute transport properties apart from porosity was dispersivity. The range of typical values for dispersivity is quite large. Lab derived dispersivity values can be orders of magnitude away from values obtained from field observations. It is typically observed that field estimates of dispersivities tend to be higher than lab measured estimates (Freeze 1979). Due to lack of site-specific information, the strategy employed in this study was to assign a typical value and calibrate it to concentration data from monitoring wells as needed. The values for longitudinal and transverse dispersivities assigned in the original model were maintained in the updated version and are provided in **Table 1**.

Table 1: Flow and Transport Parameter Summary

PROPERTY	INITIAL VALUE	CALIBRATION RANGE	FINAL VALUE
Hydraulic conductivity	1-6 ft/d	1-60 ft/d	1-60 ft/d
Specific storage (Ss)	10^{-4} per ft	10^{-3} to 10^{-6} per ft	10^{-6} per ft
Specific yield (Sy)	0.3	0.01-0.3	0.06
Porosity	0.3	0.1-0.4	0.3
Longitudinal dispersivity	265 ft	0.03-300 ft	265 ft
Transverse dispersivity	200 ft	0.03-300 ft	200 ft

2.4 MODEL INITIALIZATION AND CALIBRATION

Between URS closure in the Fall of 2018 and the completion of the extraction wells in February 2022, there was no subsurface activity in the vicinity of the URS except biannual groundwater monitoring and pumping tests at the extraction wells of CM-01 and CM-02 in July 2020. Since February 13, 2022, groundwater has been continuously extracted via wells CM-01 and CM-02 for the purpose of fluoride remediation. Therefore, relative to the dynamic nature of the groundwater hydraulics under the continuous extraction system, the conditions prior to February 2022 can be considered to be steady state.

The steady state model was built based on conditions prior to February 2022, before groundwater extraction began. The transient model run was simulated in two stress periods. The first transient stress period was 254 days long and represented the period of groundwater extraction from February 13 to October 25, 2022, which was the period extraction rate and monitoring data were available for model calibration. For the sake of simplicity, CM-01 and CM-02 were combined as a single extraction well and an average uniform pumping rate was assigned based on totalizer readings from that period.

The second transient stress period was 10,950 days (30 years) long and represented the predictive phase of the model. The purpose of this phase was to predict the fate and migration of the fluoride plume in the future. It was utilized in forecasting the time required to bring the fluoride concentration in groundwater in the vicinity of the URS below the Groundwater Protection Standard (GWPS) of 4 milligrams per liter (mg/L). This phase was not calibrated and the validity of the results from this phase is based on best possible calibration achieved in the earlier stages of the model. The best possible calibration was determined from all available data and professional judgement

related to the boundary conditions. To achieve a better calibration would require either more data or more hydrogeologic understanding into refining the boundary conditions which was not available for this effort.

There were 18 monitoring wells (referred to as 'targets') that provided the entire calibration data for the model (see **Figure 1** and **Table 2**). Head and fluoride concentration values from the monitoring activities in Q4 of 2021 were used to calibrate the steady state flow and transport model. Transient flow and concentration data was available from monitoring in Q2 of 2022 from all these locations. In addition, 7 of these locations also provided continuous hourly head readings which were all included in the calibration of the transient flow model. Details of the stress periods and calibration details are presented in **Table 3**.

Table 2: Calibration targets.

WELL NAME	EASTING	NORTHING	F CONC. DATA	TRANDUCER DATA

MW-85	2533808.627	2070175.546	Yes	Yes
MW-86	2534508.885	2070725.02	Yes	
CM-03	2534183	2070150	Yes	Yes
CM-04	2534271	2070135	Yes	Yes

Note: Monitoring data was acquired in Q4 2021 and Q2 2022. Groundwater elevations were measured at all wells listed. The locations marked 'yes' provided fluoride (F) concentration (Conc.) data and transducer data.

Table 3: Simulation details.

STRESS PERIOD	LENGTH	EXTRACTION RATE	NO. OF TARGETS	NO. OF DATA POINTS	PARAMETERS TUNED
Steady state (prior to February 2022)	--	No pumping	18	18 (head); 14 (concentration)	Hydraulic conductivity
Transient (Feb 13 – Oct 25, 2022)	254 (day)	329.4 ft^3/d (1.7 gpm)	18	29,654 (head); 25 (concentration)	Ss, Sy, porosity, dispersivity
Transient (Nov 2022 – Nov 2052)	10,950 (day)	385.9 ft^3/d (2 gpm)	--	--	--

Note: gpm = gallons per minute; ft^3/d = cubic feet per day

Root Mean Square Error (RMSE) is a standard statistic used to quantify the overall difference between the observed and the simulated groundwater head or contaminant concentration values. RMSE tells us how different the model results are from observed reality. The benchmark used for acceptable model calibration statistics is an industry standard value of Scaled RMSE of 10% or less (Environmental Simulations, Inc. 2020). Other criteria for acceptable model output are accurately simulated groundwater flow directions and head and concentration gradients based on field observation data.

3 RESULTS

3.1 STEADY STATE FLOW AND TRANSPORT

The simulated groundwater flow direction matches the overall observed groundwater flow direction. **Figure 4** shows simulated steady state groundwater potentiometric surface. The best possible steady state flow calibration statistic achieved by PEST was a scaled RMSE value of 21.5%. This high RMSE value in the steady state calibration is likely due to lack of information about the general head boundaries and the uneven clustering of target locations (e.g., targets are generally clustered in the center of the domain and spread to the north, but the southern half of the domain has no targets). Another cause may be that the relatively narrow range of head variations across the model (a total of 5 feet) can pose a challenge to numerically overcome the inherent noise in the data and lower the RMSE to less than 10%. Overall, since the model would be further calibrated in the transient phase, it was considered as an acceptable steady state calibration and the hydraulic conductivity parameters were updated.

3.2 TRANSIENT FLOW AND TRANSPORT

Simulated groundwater potentiometric surface and concentration contours of the fluoride plume at the end of the first transient stress period (October 2022) are shown on **Figures 5** and **6** respectively. The head contours clearly show a cone of depression around the pumping well location, which is expected to capture the fluoride plume.

The transient run calibration, due to the significantly larger data provided for calibration, altered the Ss, Sy parameters to further reduce the scaled RMSE of the flow model from 21.5% to 9.1%. However, the resulting Sy value of 0.017 was considered too low for the type of aquifer being simulated. Heath (Heath 1983) suggested a typical Sy value of 0.06 for semi-consolidated sandstones. The final value of Sy was set at 0.06, and the resulting scaled RMSE achieved was 11.1%, which was considered acceptable (close to 10%).

The concentration data from the monitoring wells from Q4 2021 and Q2 2022 were imported as concentration targets. A pre-calibration comparison showed that the solute transport model results were already at a scaled RMSE value of 6.4% (less than 10%). Hence, given the limited quantity of concentration data points, it was deemed unnecessary to run a PEST calibration for the transport model.

The final calibration statistics for each of the model phases are presented in **Table 4**.

Table 4: Summary of calibration statistics.

STATISTICS	STEADY STATE FLOW	TRANSIENT FLOW	F TRANSPORT
Number of Targets	18	29653	25
Range in Observed Values	1.96	4.21	20
Minimum Residual	-0.549295	-2.43005	-3.47955

Scaled RMSE (%)	21.5015	11.1349	6.3859

Head values have units of feet and concentration values have units of mg/L

3.3 30-YEAR FLOW AND TRANSPORT FORECAST

3.3.1 CURRENT EXTRACTION SYSTEM

The calibrated flow and transport model was used to forecast the fate and migration of the fluoride plume over the next 30 years at a projected extraction rate of 2 gpm (see **Figure 7** and **Figure 8**). The objective was to estimate the time it will take for the fluoride concentrations to drop below the GWPS of 4 mg/L. Fluoride concentrations above 4 mg/L were estimated at 6 out of the 18 monitoring well locations. **Figure 9** shows concentration hydrographs predicted at these 6 monitoring locations**. Table 5** presents the approximate time in years it would take for the concentration of fluoride to drop below the 4 mg/L at each of those locations.

Table 5: Time forecast for concentration to drop below 4 mg/L.

WELL NAME	TIME IN YEARS
MW-66	11.8
MW-67	12.3
MW-68	16.4
MW-69	4.4
CM-03	15.6
CM-04	18.3

Note: List includes only the monitoring well locations where the concentration of fluoride was found above 4 mg/L.

3.3.2 ADDITIONAL EXTRACTION WELLS

The impact of drilling two additional extraction wells to the north of the URS pond site was estimated using the updated model. Model simulations were created by placing two additional extraction wells (EX-01 and EX-02) along the abandoned road to the north of the URS pond. EX-01 is located north of the northwestern edge of the pond and EX-02 north of the northeastern edge of the pond. Two simulations were created with CM-02, EX-01 and EX-02 each pumping at 2 gpm and 1 gpm, respectively. The model cells around the vicinity of the extraction wells go dry (meaning predicted head is lower than the bottom elevation of the model cell) in all three simulations within 30 years.
With each well pumping at

- 2 gpm: the model cells go dry after about 1.2 years
- 1 gpm: the model goes dry after about 4 years

Having additional extraction wells leads to an expanded capture zone around the former URS pond location. **Figure 10** shows the simulated potentiometric surface at 1.2 years from present day, just before the model predicts dry conditions near the extraction wells.

Groundwater in the aquifer depth considered in this investigation under the URS site has partially originated from the operations of the URS. Therefore, this prediction of the model cells 'drying up' is favorable for the goal of remediating the plume of fluoride dissolved in the groundwater.

4 CONCLUSIONS

The following conclusions can be made from the work completed with this updated model;

- Updating transient flow and concentration data helped improve model calibration over the previous model version to an acceptable RMSE value of 11.1% for the flow model and 6.4% for the transport model.
- The calibrated model predicted that the current pump and treat system in place will be effective in reducing the fluoride concentrations in groundwater in the vicinity of the URS below 4 mg/L (GWPS) in approximately 20 years.
- Additional simulations of the model predict that placing additional extraction wells to the north of the URS pond will lead to an expanded capture zone and will dry up the near-surface groundwater system under the URS site that contains the fluoride plume.

APPENDIX

J

SEMI-ANNUAL REPORT DOCUMENTING PROGRESS ON REMEDY SELECTION MULTIUNIT 1 AND THE UPPER RETENTION SUMP

2023-07-15

Arizona Public Service Company
400 N. 5th Street
Phoenix, Arizona 85004

Subject: Semiannual Report Documenting Progress In Remedy Selection
Multiunit 1 And The Upper Retention Sump
Four Corners Power Plant - Fruitland, New Mexico

In accordance with 40 Code of Federal Regulations (CFR) Section (§) 257.97(a) of the Coal Combustion Residuals (CCR) Rule, this Semiannual Remedy Selection Progress Report (Semiannual Report) has been prepared on behalf of Arizona Public Service Company (APS) to document progress in selection of remedies for CCR units which have been identified as potentially impacting groundwater at the APS Four Corners Power Plant, located in Fruitland, New Mexico (the Site). Applicable Site CCR units include Multiunit 1 (comprised of the Lined Ash Impoundment and the Lined Decant Water Pond) and the Upper Retention Sump (URS). Semiannual progress reporting to support remedy selection began on July 15, 2019. The most recent update was provided in the *Annual Groundwater Monitoring and Corrective Action Report (GMCAR) for 2022*, dated January 31, 2023. This Semiannual Report serves as the ninth update on remedy selection progress at the site and documents activities completed to date in 2023.

SUMMARY OF ACTIVITIES COMPLETED IN 2023

Activities completed by APS in the first half of 2023 in support of remedy selection for Multiunit 1 and the URS include the following:

- *Groundwater Monitoring at Multiunit 1 and the URS*. Monitoring requirements pursuant to CFR § 257.95 have continued at both Multiunit 1 and the URS at a minimum on a semiannual basis.
- *Ongoing Operation of Extraction Wells at the URS*. In 2019 two extraction wells (CM-01, CM-02) were installed downgradient of the URS. This system is considered an interim corrective measure to evaluate the effectiveness of targeted extraction of groundwater downgradient of the URS with elevated fluoride concentrations. Transducers were installed in several wells around the URS and extraction system to monitor water level changes and evaluate performance in 2023. A performance evaluation and annual contaminant mass removal estimates from the seepage collection system will be included in the 2023 GMCAR. Additionally, the performance evaluation is expected to be included in remedy selection report.
- *Ongoing Operation of Seepage Collection Systems Downgradient of Multiunit 1*. Operation of the existing seepage intercept trench and extraction well systems has continued into 2023 and will continue throughout the year as part of interim response measures at Multiunit 1. Annual contaminant mass removal estimates from the seepage collection system will be calculated and included in the 2023 GMCAR.

WSP USA Environment & Infrastructure Inc.
4600 East Washington Street, Suite 600
Phoenix, Arizona 85034-1917

T: +1 602-733-6000
F: +1 602-733-6100
wsp.com

- *Replacement of Select Seepage Collection System Extraction Wells.* Following a well inspection program and operational assessment, select seepage collection system extraction wells were abandoned and replaced in June 2023 to improve the efficiency of this system.
- *Remedy Selection Report for the Multiunit 1 and the URS.* Preparation of a remedy selection report continued through the beginning of 2023 to document how the selected remedy will meet the requirements of 40 CFR §257.97(b).

FUTURE PLANNED ACTIVITIES

APS plans to perform the following activities in support of remedy selection during the second half of 2023 (and in upcoming years, as noted):

- *Continued Operation of the Extraction System at URS*. The extraction well system at URS will continue to serve as part of interim response measures until remedial activities begin. The seepage collection system will also likely be a part of final selected remedy.
- Integration of Additional Extraction Wells into Seepage Collection System Operations at the URS. Installation of additional extraction wells as part of the seepage collection system at the URS is planned for the second half of 2023.
- *Continued Operation of the Seepage Collection Systems Downgradient of Multiunit 1.* The seepage intercept system downgradient of Multiunit 1 will continue to serve as part of interim response measures until remedial activities begin. The seepage collection system will also likely be a part of final selected remedy.
- *Remedy Selection Reports for the URS and Multiunit 1.* Preparation of a remedy selection report documenting how the selected remedy will meet the requirements of 40 CFR §257.97(b) will continue during the second half of 2023.
- *Initiation of Remedial Activities.* Upon completion of the Multiunit 1 and URS Remedy Selection Reports, within 90 days APS will initiate and begin documentation of remedial activities for each CCR unit pursuant to 40 CFR §257.98(a).
