Analytical Methods:

| Analyte | Analyte Group | Method |
|--|-------------------|-------------|
| Chloride, Fluoride, Sulfate | Anions | EPA 300.0 |
| Beryllium, Boron, Calcium, Iron, Lithium, Magnesium, Manganese, Potassium, Sodium | Metals | EPA 200.7 |
| Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Selenium, Thallium | Metals | EPA 200.8 |
| Mercury | Metals | EPA 245.1 |
| Alkalinity | General Chemistry | SM 2320B |
| Total Dissolved Solids (TDS) | General Chemistry | SM 2540C |
| pH | General Chemistry | SM 4500 H+B |

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- U** The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- UJ** The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

| FC-CCR-MW87-0524 | 05/23/24 11:10 | 550-218891-4 | |
| FC-CCR-EB01-0524 | 05/24/24 11:25 | 550-218891-5 | Equipment blank |

Analytical Methods:

| Analyte | Analyte Group | Method |
|--|-------------------|-------------|
| Chloride, Fluoride, Sulfate | Anions | EPA 300.0 |
| Beryllium, Boron, Calcium, Iron, Lithium, Magnesium, Manganese, Potassium, Sodium | Metals | EPA 200.7 |
| Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Selenium, Thallium | Metals | EPA 200.8 |
| Mercury | Metals | EPA 245.1 |
| Alkalinity | General Chemistry | SM 2320B |
| Total Dissolved Solids (TDS) | General Chemistry | SM 2540C |
| pH | General Chemistry | SM 4500 H+B |

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- U** The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- UJ** The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Four Corners CCR Data Review

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

Yes No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

Yes No N/A

3. Samples Analyzed for alkalinity within 14 days of sampling?

Yes No N/A

4. Samples analyzed for total dissolved solids within 7 days of sampling?

Yes No N/A

5. Samples analyzed for pH within 15 minutes of sampling?

Yes No N/A

If No:

| Sample ID | Analysis | Time Between Collection and Analysis | Effect on Data Usability |
|-------------------|----------|--------------------------------------|--------------------------|
| FC-CCR-MW07-0524 | pH | 6 days, 19 hours, 14 minutes | J-HT |
| FC-CCR-MW08-0524 | pH | 6 days, 20 hours, 13 minutes | J-HT |
| FC-CCR-MW49A-0524 | pH | 11 days, 16 hours, 37 minutes | J-HT |
| FC-CCR-MW87-0524 | pH | 11 days, 19 hours, 59 minutes | J-HT |

Note:

HT = Maximum recommended hold time was exceeded.

6. Target analytes detected in the blanks?

Yes No N/A

If Yes:

| Detected Analyte | Concentration | Samples with concentrations less than 5 times the blank detection | Effect on Data Usability |
|------------------|---------------|--|--------------------------|
| Arsenic | 0.0055 mg/L | FC-CCR-MW07-0524, FC-CCR-MW08-0524, FC-CCR-MW49A-0524, FC-CCR-MW87-0524 | J-EB |
| Sodium | 18 mg/L | None | NA |

Note:

EB = Detection in an associated equipment blank.

NA = Not applicable.

Four Corners CCR Data Review

7. LCS recoveries within laboratory-specified limits?

Yes No N/A

If No:

| Analyte | Recovery | QC Limits | Affected Samples | Effect on Data Usability |
|---------|----------|-----------|--|--------------------------|
| Barium | 83%, 79% | 85-115% | FC-CCR-MW07-0524, FC-CCR-MW08-0524, FC-CCR-MW49A-0524, FC-CCR-MW87-0524 | J-LL |

Note:

LL = Low LCS recovery.

8. MS performed on a project-specific sample?

Yes No N/A

If Yes:

| Spiked Sample ID | Spiked Analyte(s) |

Analytical Methods:

| Analyte | Analyte Group | Method |
|--|-------------------|--------------|
| Chloride, Fluoride, Sulfate | Anions | EPA 300.0 |
| Antimony, Beryllium, Boron, Calcium, Iron, Magnesium, Manganese, Potassium, Sodium | Metals | EPA 200.7 |
| Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Manganese, Molybdenum, Selenium, Thallium | Metals | EPA 200.8 |
| Mercury | Metals | EPA 245.1 |
| Alkalinity | General Chemistry | SM 2320B |
| Total Dissolved Solids (TDS) | General Chemistry | SM 2540C |
| pH | General Chemistry | SM 4500 H+ B |

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- U** The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- UJ** The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete?

Yes

No

If No, provide details.

Sample Login Matched COC?

Yes

No

If no, provide details.

Sample receipt temperature $\leq 6^{\circ}\text{C}$?

Yes

No

N/A

If no, provide details.

FC-CCR-CM01 and FC-CCR-CM02 were received out of temperature at 8.0°C . WSP J qualified detects for analysis pH, Sulfate, and TDS in samples FC-CCR-CM01 and FC-CCR-CM02. (J, RT)

Note:

RT =Elevated sample receipt temperature.

Other sample receipt issues?

Yes

No

If yes, provide details.

Four Corners CCR Data Review

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

Yes No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

Yes No N/A

3. Samples Analyzed for alkalinity within 14 days of sampling?

Yes No N/A

4. Samples analyzed for total dissolved solids within 7 days of sampling?

Yes No N/A

5. Samples analyzed for pH within 15 minutes of sampling?

Yes No N/A

If No:

| Sample ID | Analysis | Time Between Collection and Analysis | Effect on Data Usability |
|-------------------|----------|--------------------------------------|--------------------------|
| FC-CCR-MW67-1024 | pH | 5 Days, 8 Hours, 40 Minutes | J-HT |

Note:

HT = Holding time exceeded.

Four Corners CCR Data Review

6. Target analytes detected in the blanks?

Yes No N/A

If Yes:

| Detected Analyte | Concentration | Samples with concentrations less than 5 times the blank detection | Effect on Data Usability |
|------------------|---------------|---|--------------------------|
| Calcium | 44.2 ug/L | None | NA |
| Lithium | 0.19 ug/L | None | NA |
| Boron | 42.1 ug/L | FC-CCR-MW64-1024 | J-MB |
| Sodium | 177 ug/L | None | NA |
| Boron (20-30) | 64.2 ug/L | None | NA |
| Calcium | 43.7 ug/L | None | NA |
| Magnesium | 127 ug/L | None | NA |
| Manganese | 0.80 ug/L | None | NA |
| Sodium | 147 ug/L | None | NA |

Notes:

MB = The concentration detected in the sample was less than five times the concentration detected in the blank.

7. LCS recoveries within laboratory-specified limits?

Yes No N/A

If No:

| Analyte | Recovery | QC Limits | Affected Samples | Effect on Data Usability |
|---------|----------|-----------|------------------|--------------------------|
| | | | | |

8. MS performed on a project-specific sample?

Yes No N/A

If Yes:

| Spiked Sample ID | Spiked Analyte(s) |
|---|---|
| FC-CCR-CM02-1024, FC-CCR-EW12R-1024, FC-CCR-FD08-1024 | Fluoride |
| FC-CCR-MW67-1024 | Mercury, Antimony, Beryllium, Boron, Calcium |
| FC-CCR-CM01-1024 | Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, Thallium |

| FC-CCR-MW64-1024 | Sodium | 435%, 484% | 70-130% | NA4 |
| FC-CCR-SW1-1024 | Antimony | 39%, RPD | 20% | J-HD |
| FC-CCR-SW1-1024 | Arsenic | 38%, RPD | 20% | J-HD |
| FC-CCR-SW1-1024 | Molybdenum | 38%, RPD | 20% | J-HD |
| FC-CCR-SW1-1024 | Selenium | 37%, RPD | 20% | J-HD |
| FC-CCR-MW82S-1024 | Chloride | 0%, 0% | 90-110% | NA4 |
| FC-CCR-MW82S-1024 | Sulfate | 0%, 0% | 90-110% | NA4 |
| FC-CCR-MW01-1024 | Boron | -40%, -19% | 70-130% | NA4 |
| FC-CCR-MW01-1024 | Calcium | 50%, 22% | 70-130% | NA4 |
| FC-CCR-MW01-1024 | Magnesium | -184%, -130% | 70-130% | NA4 |
| FC-CCR-MW01-1024 | Sodium | -187%, -132% | 70-130% | NA4 |
| FC-CCR-ASHPONDV6-1024 | Boron | 159%, MS | 70-130% | NA4 |
| FC-CCR-ASHPONDV6-1024 | Magnesium | 133%, MS | 70-130% | NA4 |
| FC-CCR-MW82S-1024 | Boron | 135%, 497% | 70-130% | NA4 |
| FC-CCR-MW82S-1024 | Calcium | 153%, MSD | 70-130% | NA4 |
| FC-CCR-MW82S-1024 | Magnesium | 217%, MSD | 70-130% | NA4 |
| FC-CCR-MW82S-1024 | Potassium | 132%, MSD | 70-130% | NA4 |
| FC-CCR-MW82S-1024 | Sodium | 386%, 602% | 70-130% | NA4 |

Notes:

NA4 = The concentration detected in the unspiked native sample is more than four times the spike concentration and it is not possible to assess data usability based on the MS recovery

HD = Imprecision between the MS and MSD results.

LM = Low MS recovery.

HM = High MS recovery.

Four Corners CCR Data Review

9. Field duplicate collected?

Yes No

If Yes:

| Parent Sample | Field Duplicate |
|-------------------|------------------|
| RC-CCR-MW30-1024 | RC-CCR-FD04-1024 |
| FC-CCR-DMX01-1024 | FC-CCR-FD06-1024 |
| FC-CCR-MW19-1024 | FC-CCR-FD07-1024 |
| FC-CCR-MW82S-1024 | FC-CCR-FD08-1024 |

a. Are RPDs between primary and duplicate results $\leq 20\%$ or are differences between analyte concentrations \leq the reporting limit?

Yes No N/A

If No:

| Primary Sample ID | Duplicate Sample ID | Analyte | RPD | Effect on Data Usability |
|-------------------|---------------------|---------|-----|--------------------------|
| | | | | |

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes No N/A

If Yes:

| Sample ID | Analysis |
|---|-----------------------------|
| FC-CCR-CM02-1024, FC-CCR-MW65-1024, FC-CCR-SW3-1024, FC-CCR-SUMP18-1024, FC-CCR-FD08-1024 | TDS |
| FC-CCR-MW64-1024, FC-CCR-MW82S-1024 | Chloride, Sulfate, Fluoride |
| FC-CCR-EW12R-1024, FC-CCR-CM02-1024 | Fluoride |
| FC-CCR-MW62-1024, FC-CCR-FD08-1024 | pH |

a. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes No N/A

If No:

| Sample ID | Analyte | Effect on Data Usability |
|-----------|---------|--------------------------|
| | | |

Four Corners CCR Data Review

11. Are there other QC issues that affect data quality?

Yes No

If Yes:

Detections with concentrations between the detection and reporting limits were J qualified as being quantitatively uncertain. (J, DL)

Note:

DL = The detected concentration was between the detection and reporting limits.

12. Are non-detect results sufficiently low to meet EPA and Alternative GWPS primary drinking water criteria?

Yes No

| Analyte | List | MCL | Alternative GWPS | Units |
|-------------------------|-----------------|-------|------------------|-------|
| Antimony | Appendix IV | 0.006 | -- | mg/L |
| Arsenic | Appendix IV | 0.010 | -- | mg/L |
| Barium | Appendix IV | 2 | -- | mg/L |
| Beryllium | Appendix IV | 0.004 | -- | mg/L |
| Boron | Appendix III | -- | -- | mg/L |
| Cadmium | Appendix IV | 0.005 | -- | mg/L |

Four Corners CCR Data Review

Analytical Methods:

| Analyte | Analyte Group | Method |
|---|-------------------|-------------|
| Chloride, Fluoride, Sulfate | Anions | EPA 300.0 |
| Beryllium, Boron, Calcium | Metals | EPA 200.7 |
| Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, Thallium | Metals | EPA 200.8 |
| Mercury | Metals | EPA 245.1 |
| Total Dissolved Solids (TDS) | General Chemistry | SM 2540C |
| pH | General Chemistry | SM 4500 H+B |

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- U** The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- UJ** The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Note:

HT = Maximum recommended hold time was exceeded.

6. Target analytes detected in the blanks?

Yes No N/A

If Yes:

| Detected Analyte | Concentration | Samples with concentrations less than 5 times the blank detection | Effect on Data Usability |
|------------------|---------------|---|--------------------------|
| Barium | 0.97 ug/L | None | NA |

Note:

NA = Not applicable.

Four Corners CCR Data Review

7. LCS recoveries within laboratory-specified limits?

Yes No N/A

If No:

| Analyte | Recovery | QC Limits | Affected Samples | Effect on Data Usability |
|---------|----------|-----------|------------------|--------------------------|
| | | | | |

8. MS performed on a project-specific sample?

Yes No N/A

If Yes:

| Spiked Sample ID | Spiked Analyte(s) |
|-------------------|--|
| FC-CCR-URS06-1024 | Chloride, Fluoride, Sulfate, Mercury, Beryllium, Boron, Calcium, Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, Thallium |
| FC-CCR-MW86-1024 | Mercury, Beryllium, Boron, Calcium |
| FC-CCR-MW66-1024 | Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, Thallium |

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes No N/A

If No:

| Sample ID | Analyte | RPD or Recovery | Accuracy or Recovery Limits | Effect on Data Usability |
|-------------------|------------|-----------------|-----------------------------|--------------------------|
| FC-CCR-URS06-1024 | Chloride | 0%, 0% | 80-120% | NA4 |
| FC-CCR-URS06-1024 | Sulfate | 0%, 0% | 80-120% | NA4 |
| FC-CCR-URS06-1024 | Boron | -763%, 263% | 70-130% | NA4 |
| FC-CCR-URS06-1024 | Calcium | -58%, MS | 70-130% | NA4 |
| FC-CCR-MW86-1024 | Boron | 1290%, MS | 70-130% | NA4 |
| FC-CCR-MW66-1024 | Antimony | 21% | 20% | None |
| FC-CCR-MW66-1024 | Arsenic | 21% | 20% | J-HD |
| FC-CCR-MW66-1024 | Molybdenum | 24% | 20% | J-HD |
| FC-CCR-MW66-1024 | Selenium | 23% | 20% | J-HD |

Note:

NA4 = Analyte concentration in the unspiked native sample is greater than four times the spike concentration

HD = Imprecision between matrix spike and matrix spike duplicate.

Four Corners CCR Data Review

9. Field duplicate collected?

Yes No

If Yes:

| Parent Sample | Field Duplicate |
|-------------------|------------------|
| FC-CCR-URS05-1024 | FC-CCR-FD01-1024 |
| FC-CCR-URS06-1024 | FC-CCR-FD02-1024 |
| FC-CCR-MW86-1024 | FC-CCR-FD03-1024 |

b. Are RPDs between primary and duplicate results \leq 20% or are differences between analyte concentrations \leq the reporting limit?

Yes No N/A

If No:

| Primary Sample ID | Duplicate Sample ID | Analyte | RPD | Effect on Data Usability |
|-------------------|---------------------|---------|-----|--------------------------|
| | | | | |

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes No N/A

If Yes:

| Sample ID | Analysis |
|-------------------|---------------------------------|
| FC-CCR-MW84-1024 | Total Dissolved Solids |
| FC-CCR-URS06-1024 | pH, Chloride, Fluoride, Sulfate |

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes No N/A

If No:

| Sample ID | Analyte | Effect on Data Usability |
|-----------|---------|--------------------------|
| | | |

11. Other sample receipt issues?

Yes No

If yes, provide details.

Detections with concentrations less than the reporting limit were J qualified as being quantitatively uncertain. (J, DL)

Four Corners CCR Data Review

12. Are non-detect results sufficiently low to meet EPA or Alternative GWPS primary drinking water criteria?

(Yes)

No

| Analyte | List | MCL | Alternative GWPS | Units |
|-------------------------|-----------------|-------|------------------|-------|
| Antimony | Appendix IV | 0.006 | -- | mg/L |

| Chloride, Fluoride, Sulfate | Anions | EPA 9056A |
| Beryllium, Boron, Calcium, Iron, Magnesium, Manganese, Potassium, Sodium | Metals | EPA 200.7 |
| Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, Thallium | Metals | EPA 200.8 |
| Total Dissolved Solids (TDS) | General Chemistry | SM 2540C |
| Alkalinity | General Chemistry | SM 2320B |
| pH | General Chemistry | SM 9040C |

Four Corners CCR Data Review

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- U** The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- UJ** The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

No

If yes, provide details.

Four Corners CCR Data Review

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

Yes No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

Yes No N/A

3. Samples Analyzed for alkalinity within 14 days of sampling?

Yes No N/A

4. Samples analyzed for total dissolved solids within 7 days of sampling?

Yes No N/A

5. Samples analyzed for pH within 15 minutes of sampling?

Yes No N/A

If No:

| Sample ID | Analysis | Time Between Collection and Analysis | Effect on Data Usability |
|--------------------|----------|--------------------------------------|--------------------------|
| FC-CCR-MW24-1124 | pH | 6 Days, 7 Hours, 53 Minutes | J-HT |
| FC-CCR-DMX05R-1124 | pH | 6 Days, 9 Hours, 34 Minutes | J-HT |
| FC-CCR-MW15-1124 | pH | 5 Days, 8 Hours, 8 Minutes | J-HT |
| FC-CCR-MW11-1124 | pH | 5 Days, 10 Hours, 19 Minutes | J-HT |
| FC-CCR-MW18-1124 | pH | 5 Days, 5 Hours, 29 Minutes | J-HT |
| FC-CCR-MW16-1124 | pH | 5 Days, 9 Hours, 12 Minutes | J-HT |
| FC-CCR-MW17R-1124 | pH | 5 Days, 6 Hours, 42 Minutes | J-HT |
| FC-CCR-DMX06-1024 | pH | 8 Days, 6 Hours, 45 Minutes | J-HT |
| FC-CCR-DMX04-1124 | pH | 5 Days, 4 Hours, 16 Minutes | J-HT |
| FC-CCR-FD09-1124 | pH | 5 Days, 13 Hours, 55 Minutes | J-HT |
| FC-CCR-DMX03-1024 | pH | 7 Days, 7 Hours, 52 Minutes | J-HT |
| FC-CCR-MW05-1124 | pH | 6 Days, 10 Hours, 32 Minutes | J-HT |

Note:

HT = Maximum recommended hold time was exceeded.

Four Corners CCR Data Review

6. Target analytes detected in the blanks?

Yes No N/A

If Yes:

| Detected Analyte | Concentration | Samples with concentrations less than 5 times the blank detection | Effect on Data Usability |
|------------------|---------------|---|--------------------------|
| Chloride | 559 ug/L | NONE | NA |
| Fluoride | 80.4 ug/L | NONE | NA |
| Sulfate | 1040 ug/L | NONE | NA |
| Iron | 29.9 ug/L | FC-CCR-MW24-1124 FC-CCR-EW14-1124 FC-CCR-MW34-1124 FC-CCR-MW18-1124 FC-CCR-MW16-1124 FC-CCR-MW17R-1124 FC-CCR-DMX06-1024 FC-CCR-DMX04-1124 FC-CCR-FD09-1124 FC-CCR-EW15-1124 FC-CCR-MW05-1124 | U-MB |
| Sodium | 162 ug/L | NONE | NA |

Note:

MB = The concentration detected in the sample was less than five times the concentration detected in the blank.

7. LCS recoveries within laboratory-specified limits?

Yes No N/A

If No:

| Analyte | Recovery | QC Limits | Affected Samples | Effect on Data Usability |
|---------|----------|-----------|------------------|--------------------------|
| | | | | |

8. MS performed on a project-specific sample?

Yes No N/A

If Yes:

| Spiked Sample ID | Spiked Analyte(s) |
|--------------------|---|
| FC-CCR-MW24-1124 | Beryllium, Boron, Calcium, Iron, Magnesium, Manganese, Potassium, Sodium |
| FC-CCR-DMX04-1124 | Beryllium, Boron, Calcium, Iron, Magnesium, Manganese, Potassium, Sodium |
| FC-CCR-MW15-1124 | Beryllium, Boron, Calcium, Iron, Magnesium, Manganese, Potassium, Sodium |
| FC-CCR-FD09-1124 | Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, Thallium |
| FC-CCR-DMX05R-1124 | Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, Thallium |

Four Corners CCR Data Review

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes No N/A

If No:

| Sample ID | Analyte | RPD or Recovery | Accuracy or Recovery Limits | Effect on Data Usability |
|-------------------|-----------|-----------------|-----------------------------|--------------------------|
| FC-CCR-MW24-1124 | Calcium | 58%, 56% | 70-130% | NA4 |
| FC-CCR-MW24-1124 | Sodium | -1030%, -992% | 70-130% | NA4 |
| FC-CCR-DMX04-1124 | Magnesium | 146%, MS | 70-130% | NA4 |
| FC-CCR-DMX04-1124 | Sodium | 527%, MS | 70-130% | NA4 |
| FC-CCR-MW15-1124 | Calcium | -75%, 54% | 70-130% | NA4 |
| FC-CCR-MW15-1124 | Magnesium | 31%, 40% | 70-130% | NA4 |
| FC-CCR-MW15-1124 | Sodium | -809%, -180% | 70-130% | NA4 |

Notes:

NA4 = The concentration detected in the unspiked native sample is more than four times the spike concentration and it is not possible to assess data usability based on the MS recovery.

9. Field duplicate collected?

Yes No

If Yes:

| Parent Sample | Field Duplicate |
|-------------------|------------------|
| FC-CCR-MW17R-1124 | FC-CCR-FD09-1124 |

b. Are RPDs between primary and duplicate results $\leq 20\%$ or are differences between analyte concentrations \leq the reporting limit?

Yes No N/A

If No:

| Primary Sample ID | Duplicate Sample ID | Analyte | RPD | Effect on Data Usability |
|-------------------|---------------------|---------|-----|--------------------------|
| | | | | |

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes No N/A

If Yes:

| Sample ID | Analysis |
|--------------------|------------|
| FC-CCR-DMX03-1024 | TDS |
| FC-CCR-MW11-1124 | TDS |
| FC-CCR-DMX05R-1124 | Alkalinity |
| FC-CCR-DMX06-1024 | Alkalinity |

Four Corners CCR Data Review

- c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes

No

N/A

If No:

| Sample ID | Analyte | Effect on Data Usability |
|-----------|---------|--------------------------|
| | | |

11. Are there other QC issues that affect data quality?

Yes

No

If Yes:

Detections with concentrations less than the reporting limit were J qualified as being quantitatively uncertain. (J, DL)

Notes:

DL = The detected concentration was less than the reporting limit.

Four Corners CCR Data Review

12. Are non-detect results sufficiently low to meet EPA and Alternative GWPS primary drinking water criteria?

Yes No

| Analyte | List | MCL | Alternative GWPS | Units |
|-------------------------|-----------------|-------|------------------|-------|
| Antimony | Appendix IV | 0.006 | -- | mg/L |
| Arsenic | Appendix IV | 0.010 | -- | mg/L |

Sample Summary:

| Field Sample Identification | Collection Date and Time | Laboratory Sample Identification | Notes |
|-----------------------------|--------------------------|----------------------------------|-------|
| FC-CCR-MW43-1124 | 11/15/24 12:24 | L1801396-01 | |
| FC-CCR-MW50A-1124 | 11/15/24 16:41 | L1801396-02 | |

Analytical Methods:

| Analyte | Analyte Group | Method |
|--|-------------------|-------------|
| Chloride, Fluoride, Sulfate | Anions | EPA 300.0 |
| Beryllium, Boron, Calcium, Lithium | Metals | EPA 200.7 |
| Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Selenium, Thallium | Metals | EPA 200.8 |
| Mercury | Metals | EPA 245.1 |
| Total Dissolved Solids (TDS) | General Chemistry | SM 2540C |
| pH | General Chemistry | SM 4500 H+B |

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- U** The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- UJ** The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

If Yes:

| Detected Analyte | Concentration | Samples with concentrations less than 5 times the blank detection | Effect on Data Usability |
|------------------|---------------|---|--------------------------|
| | | | |

7. LCS recoveries within laboratory-specified limits?

Yes No N/A

If No:

| Analyte | Recovery | QC Limits | Affected Samples | Effect on Data Usability |
|---------|----------|-----------|------------------|--------------------------|
| | | | | |

Four Corners CCR Data Review

8. MS performed on a project-specific sample?

Yes No N/A

If Yes:

| Spiked Sample ID | Spiked Analyte(s) |
|------------------|-------------------|
| | |

a. Are MS recoveries and/or precision within laboratory specified limits?

Yes No N/A

If No:

| Sample ID | Analyte | RPD or Recovery | Accuracy or Recovery Limits | Effect on Data Usability |
|-----------|---------|-----------------|-----------------------------|--------------------------|
| | | | | |

9. Field duplicate collected?

Yes No

If Yes:

| Parent Sample | Field Duplicate |
|-------------------|------------------|
| FC-CCR-MW17R-1124 | FC-CCR-FD09-1124 |

b. Are RPDs between primary and duplicate results $\leq 20\%$ or are differences between analyte concentrations \leq the reporting limit?

Yes No N/A

If No:

| Primary Sample ID | Duplicate Sample ID | Analyte | RPD | Effect on Data Usability |
|-------------------|---------------------|------------|-----|--------------------------|
| FC-CCR-MW17R-1124 | FC-CCR-FD09-1124 | Radium 228 | 92% | J-FD |

Note:

FD = Imprecision between primary and field duplicate results.

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes No N/A

If Yes:

| Sample ID | Analysis |
|-----------|----------|
| | |

c. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes No N/A

Four Corners CCR Data Review

If No:

| Sample ID | Analyte | Effect on Data Usability |
|-----------|---------|--------------------------|
| | | |

APPENDIX

G

GROUNDWATER QUALITY
DATA TABLES THROUGH 2024

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:

< = less than

BTV = Background Threshold Value

degrees C = degrees Celsius

GWPS = Groundwater Protection Standard

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.

mg/L = milligrams per liter

pCi/L = Picocuries per liter

su = standard units

UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:

- < = less than
- BTV = Background Threshold Value
- degrees C = degrees Celsius
- GWPS = Groundwater Protection Standard
- J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
- mg/L = milligrams per liter
- pCi/L = Picocuries per liter
- su = standard units
- UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:

< = less than

BTV = Background Threshold Value

degrees C = degrees Celsius

GWPS = Groundwater Protection Standard

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.

mg/L = milligrams per liter

pCi/L = Picocuries per liter

su = standard units

UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:

- * data appears anomalous
- < = less than
- BTV = Background Threshold Value
- degrees C = degrees Celsius
- GWPS = Groundwater Protection Standard
- J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- mg/L = milligrams per liter
- pCi/L = Picocuries per liter
- su = standard units
- U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.
- UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Notes:

BTV exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:

- * data appears anomalous
- < = less than
- BTV = Background Threshold Value
- degrees C = degrees Celsius
- GWPS = Groundwater Protection Standard
- J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- mg/L = milligrams per liter
- pCi/L = Picocuries per liter
- su = standard units
- U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.
- UJ = The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

**Table G-7
Groundwater Sampling Results for the CWTP Monitoring Wells - Appendix III Constituents**

| | | | | | Appendix III Constituents | | | | | | | |
|--|----------|------------------|-------------|-------------------------|---------------------------|---------|----------|--------------|------------------------|-----------------------------|---------|------------------------|
| Constituent: | | | | | Boron | Calcium | Chloride | Fluoride | pH (Field Measurement) | pH (Laboratory Measurement) | Sulfate | Total Dissolved Solids |
| Filtered: | | | | | N | N | N | N | N | N | N | N |
| Units: | | | | | mg/L | mg/L | mg/L | mg/L | su | su | mg/L | mg/L |
| CWTP BTW (applicable to MW-62) | | | | | 2 | 536 | 631 | 1.8 | 6.5 - 6.9 | 6.5 - 6.9 | 13,000 | 20,000 |
| CWTP BTW (applicable to MW-63) | | | | | 2 | 536 | 631 | 2.3 | 6.5 - 6.9 | 6.5 - 6.9 | 13,000 | 20,000 |
| CWTP BTW (applicable to MW-64) | | | | | 0.73 | 486 | 631 | 1.6 | 7.23 - 7.66 | 7.23 - 7.66 | 13,000 | 20,000 |
| CWTP BTW (applicable to MW-65) | | | | | 0.73 | 486 | 631 | 2.1 | 7.00 - 7.44 | 7.00 - 7.44 | 13,000 | 20,000 |
| CWTP GWPS (applicable to downgradient wells) | | | | | -- | -- | -- | -- | -- | -- | -- | -- |

Notes:
BTV exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:
 < = less than
 BTV = Background Threshold Value
 J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
 mg/L = milligrams per liter
 NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
 pCi/L = Picocuries per liter
 su = standard units
 U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.

Table G-8
Groundwater Sampling Results for the CWTP Monitoring Wells - Appendix IV Constituents

Notes:
BTW exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:
 < = less than
 BTW = Background Threshold Value
 J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
 mg/L = milligrams per liter
 NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
 pCi/L = PicoCuries per liter
 su = standard units
 U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.

Notes:
BTW exceedances are shown in grey shaded cells. GWPS exceedances are shown in red text.

Abbreviations and Data Qualifiers:
 < = less than
 BTW = Background Threshold Value
 J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
 mg/L = milligrams per liter
 NJ = The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
 pCi/L = Picocuries per liter
 su = standard units
 U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.

Abbreviations and Data Qualifiers:

< = less than reporting limit (or the method detection limit for beryllium results)

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

mg/L = milligrams per liter

pCi/L = Picocuries per liter

su = standard units

U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.

Abbreviations and Data Qualifiers:
 < = less than reporting limit (or the method detection limit for beryllium results)
 J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
 mg/L = milligrams per liter
 pCi/L = Picocuries per liter
 su = standard units
 U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.

Abbreviations and Data Qualifiers:

- *data appear anomalous
- < = less than reporting limit (or the method detection limit for fluoride and beryllium results)
- degrees C = degrees Celsius
- J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- mg/L = milligrams per liter
- pCi/L = Picocuries per liter
- su = standard units
- U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.

Abbreviations and Data Qualifiers:
 *data appear anomalous
 < = less than reporting limit (or the method detection limit for fluoride and beryllium results)
 degrees C = degrees Celsius
 J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
 mg/L = milligrams per liter
 pCi/L = Picocuries per liter
 su = standard units
 U = The analyte was analyzed for, but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.

Re: **CCR GROUNDWATER ASSESSMENT MONITORING
STATISTICAL ANALYSIS FOR THE UPPER RETENTION SUMP
BACKGROUND THRESHOLD VALUE UPDATE
Arizona Public Service Company Four Corners Power Plant - Fruitland, New Mexico**

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) presents an update to the background statistical evaluation for groundwater at the Upper Retention Sump (URS) at the Arizona Public Service Company (APS) Four Corners Power Plant (Site) in Fruitland, New Mexico. The statistical evaluation was performed by Geosciences Consulting LLC (Geosciences Consulting), a subcontractor to WSP USA Environment and Infrastructure, Inc. (WSP) pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (CCR Rule) (Federal Register, 2020) as part of an analysis performed for the Combine Waste Treatment Pond (CWTP) (WSP, 2024).

The URS CCR unit at the Site is undergoing corrective action and is in the assessment monitoring program. The URS is in corrective action based concentrations of fluoride exceeding the groundwater protection standard (GWPS) in wells MW-66, MW-67, MW-68, and MW-69 (Wood, 2018). The URS groundwater monitoring well network consists of three background monitoring wells (MW-71, MW-72 and MW-73) which are also the background monitoring wells for the CWTP.

The statistical evaluation documented herein incorporates Appendix IV constituent data collected from URS/CWTP background monitoring wells (MW-71, MW-72 and MW-73) through November 2023 (the Fall 2023 event). The BTVs presented in this Tech Memo were updated in accordance with the Statistical Data Analysis Work Plan (SDAWP) for the Site (WSP, 2023a) including data through November 2023.

2.0 STATISTICAL EVALUATION RESULTS

The statistical evaluation conducted by Geosciences Consulting was presented in the *Statistical Analysis and Results for the CWTP Appendix IV Constituent Data Collected through November 2023 Technical Memorandum* (WSP, 2024). The Technical Memorandum documented updates to the BTVs and GWPS for assessment monitoring (i.e., Appendix IV Constituents) groundwater data associated with the CWTP background wells. Since both units use the same monitoring locations as background the BTVs were deemed to be representative of background conditions for the URS and **Table 1** presents the results of the Geosciences statistically analysis with the updated BTV values for each Appendix IV constituents.

The methods applied in the statistical analysis were performed in accordance with the Four Corners SDAWP (WSP, 2023a) and the Groundwater Protection Standards (GWPSs) established in October 2023 Tech Memo (WSP, 2023b). **Table 1** summarizes the GWPSs for the URS/CWTP Appendix IV constituents and their respective method of calculation. The GWPS constitutes either/or: 1) the statistically calculated BTV, 2) the United States Environmental Protection Agency's (USEPA) promulgated Maximum

Contaminant Level (MCL) (40 CFR, Part 141), or 3) the risk-based alternative GWPS identified for constituents without MCLs (40 CFR 257.95(h)(2)), whichever value is highest.

The GWPS selection changed for antimony, cobalt, fluoride, lithium, and selenium and the BTVs were updated for all constituents excluding barium, mercury, and molybdenum (**Table 1**). The changes were the following:

- BTV for antimony was lowered from 0.010 to 0.00027 mg/L and the GWPS selection was changed to the US EPA MCL of 0.0060 mg/L.
- BTV for chromium was lowered from 0.010 to 0.0014 mg/L and the GWPS remained at the US EPA MCL of 0.10 mg/L.
- BTV for cobalt was lowered from 0.016 to 0.014 mg/L.
- BTV for lead was lowered from 0.005 to 0.0011 mg/L.
- BTV for thallium was lowered from 0.0014 to 0.0012 mg/L.
- BTV for combined radium was lowered to 4.16 mg/L and the GWPS selection was changed to the US EPA MCL of 5.0 mg/L.
- BTV for fluoride was increased from 4.0 to 4.2 mg/L and the GWPS selection was changed to the BTV.
- BTV for beryllium was increased from 0.0010 to 0.0022 mg/L.
- BTV for cadmium was lowered from 0.0010 to 0.00021 mg/L.
- BTV for lithium was increased from 0.80 to 0.89 mg/L.
- BTV for selenium was increased from 0.45 to 0.47 mg/L.

3.0 RECOMMENDATIONS

Based on the results of the statistical evaluation presented in the CWTP Tech Memo (WSP, 2024) and pursuant to the CCR Rule, the BTVs and the GWPSs should be updated routinely (i.e., every 2 to 3 years). Additionally, the laboratory should achieve reporting limits below the U.S. EPA's promulgated MCLs and maintain a constant reporting limit for each analyte over time for all monitoring wells – background and compliance.

Re: **CCR GROUNDWATER ASSESSMENT MONITORING
STATISTICAL ANALYSIS FOR THE MULTIUNIT 1
BACKGROUND THRESHOLD VALUES UPDATE
Arizona Public Service Company Four Corners Power Plant – Fruitland, New Mexico**

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) presents an update to the background statistical evaluation for groundwater at the CCR multiunit referred to as Multiunit 1 comprised of the Lined Ash Impoundment (LAI) and the lined Decant Water Pond (LDWP) located at the Arizona Public Service Company (APS) Four Corners Plant (Site) in Fruitland, New Mexico. The statistical evaluation was performed by Geosciences Consulting LLC (Geosciences Consulting), pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (CCR Rule) (Federal Register, 2020) and the Site's certified the Statistical Data Analysis Work Plan (SDAWP).

The Multiunit 1 is following an assessment monitoring program and is undergoing corrective action. Groundwater corrective action is based on concentrations of cobalt and molybdenum exceeding the groundwater protection standard (GWPS) at various monitoring wells downgradient of the unit (Wood, 2018). The Multiunit 1 closure is projected to be completed in 2028 (WSP, 2023).

The statistical evaluation documented herein provides an update to the background threshold values (BTVs) established in 2018 (Wood, 2018) by incorporating additional Appendix IV constituent data collected from Multiunit 1 background monitoring wells (including MW-12R1, MW-43, MW-49A, MW-51, MW-50A, MW-55R, and MW-74) through May 2024 (the Spring 2024 event). The BTVs presented in this Tech Memo were updated in accordance with the SDAWP for the Site (WSP, 2023).

2.0 STATISTICAL EVALUATION RESULTS

Attachment A presents the statistical methods and evaluation conducted by Geosciences Consulting and summarizes the updated GWPS selection for each Appendix IV constituent.

As described in 40 CFR § 257.95(h)(1-3), the GWPS is:

- ▶ The maximum contaminant level (MCL) established under §§141.62 and 141.66 of this title.
- ▶ Where an MCL has not been established, Regional Screening Levels (RSLs) have been specified for cobalt (0.006 mg/L), lead (0.015 mg/L), lithium (0.040 mg/L), or molybdenum (0.100 mg/L).

- ▶ The respective background level for a constituent when the background level is higher than the MCL or rule identified GWPS.

In accordance with the rule requirements, background concentrations were evaluated to establish Site-specific GWPS for statistical comparison of Appendix IV constituents. Based on the analysis, the GWPS has been updated for each of the Appendix IV constituents. Table 1 in **Attachment A** presents a summary of the comparison criteria and the established GWPS using pooled data from MW-49A and MW-74. The spatial heterogeneity observed in the pooled M-49A and MW-74 data should be evaluated, and BTVs updated as necessary in a subsequent review. The updated GWPS are as follows:

- ▶ **Antimony:** Adjusted from the previous BTV of 0.01 mg/L to the US EPA MCL of 0.006 mg/L.
- ▶ **Cobalt:** Adjusted from the previous BTV of 0.01 mg/L to the alternative risk-based GWPS of 0.006 mg/L.
- ▶ **Fluoride:** Adjusted from the previous BTV of 5 mg/L to the US EPA MCL of 4 mg/L.
- ▶ **Selenium:** Adjusted from the previous BTV of 0.017 mg/L to the updated BTV of 0.12 mg/L. For reference, the preliminary single-well BTV calculated in 2022 for selenium, but never adopted, and using sample data from M-74 (Geosciences, 2022) was 0.19 mg/L.
- ▶ **Thallium:** Adjusted from the previous BTV of 0.017 mg/L to the US EPA MCL of 0.002 mg/L.
- ▶ **Lithium:** Adjusted from the previous BTV of 1.80 mg/L to the updated BTV of 1.54 mg/L. For reference, the preliminary single-well BTV calculated in 2022 (Geosciences, 2022) was 1.53 mg/L.
- ▶ **Molybdenum:** the updated BTV is now matches the alternative risk-based GWPS; however, the GWPS concentration remains unchanged.

Multiunit 1 CCR Assessment Monitoring Background Threshold Values Update
October 2024
Arizona Public Service Company Four Corners Power Plant – Fruitland, New Mexico

1.0 INTRODUCTION

This Memorandum for File (Memo) documents updates to the Background Threshold Values (BTVs) for assessment monitoring (i.e., Appendix IV constituents) groundwater data associated with the Multiunit 1 (Multiunit) located at the Arizona Public Service Company (APS) Four Corners Power Plant (FCPP) in Fruitland, New Mexico. This statistical evaluation is completed by Geoscience Consulting Strategies LLC in accordance with the Statistical Data Analysis Work Plan (SDAWP) for the FCPP (WSP USA Environment & Infrastructure Inc [WSP], 2023).

The groundwater protection standards (GWPSs) for Appendix IV constituents for the Multiunit constitute either: 1) statistically-driven BTVs, 2) the applicable U.S. Environmental Protection Agency (EPA) Maximum Contaminant Level (MCL) promulgated under the Safe Drinking Water Act, or 3) alternative risk-based GWPSs established in the statute, whichever is higher (40 Code of Federal Regulations [CFR] Section [§] 257.95(h) [Federal Register, 2020]). Updates to the statistically-driven BTVs will initiate the re-selection of GWPSs, as necessary.

The Multiunit is in the corrective action phase and has an estimated planned closure date for 2028 (WSP, 2023). The closure plan for the Lined Ash Impoundment (LAI) and the Lined Decant Water Pond (LDWP) is applicable to the Multiunit and states, in part, that the coal combustion residual (CCR) in these units will be closed in place and capped with an evapotranspiration cover. Dewatering of CCR Unit(s) must occur prior to capping to safely construct the final cover system. A pilot dewatering well study was completed in July 2023 (WSP,2024).

The following sections detail data inputs, methods, results and recommendations.

2.0 DATA INPUTS

The Multiunit 1 CCR groundwater monitoring well network consists of seven background monitoring wells (MW-74, MW-12R1, MW-43, MW-49A, MW-50A, MW-51 and MW-55R). The FCPP SDAWP (WSP, 2023) identifies five background wells (MW-12R1, MW-43, MW-50A, MW-51 and MW-55R) are routinely dry of have insufficient saturated thickness that precludes sampling. The Multiunit has six compliance (i.e.,

downgradient) monitoring wells (MW-7, MW-8, MW-61, MW-75, MW-40R and MW-76) and two of these monitoring wells (MW-40R and MW-76) are routinely dry or have limited saturated thickness that precludes sampling.

The period of data evaluation ranges from September 2014 to May 2024. Appendix A contains the sample data for the subject update. Depending on the Appendix IV constituent, the minimal sample number for this statistical evaluation ranges between 35 to 50.

Data inputs for this statistical analysis were prepared, and provided by, WSP. As shown in Appendix A, the Appendix IV analytes are listed by name or chemical symbol as column headers as required by the statistical software (i.e., ProUCL) (EPA, 2015). By convention, each analyte has a corresponding data column (indicated with a "D_" prefix) that indicates if the analyte was detected or not at a concentration that exceeds the analytical reporting limit, where detectable concentrations are symbolized by a "1" and non-detectable concentrations are symbolized by a "0." For consistency purposes, the data were pooled from background wells MW-49A and M-74 to complete this analysis.

3.0 METHODS

To establish current GWPSs for the Multiunit, updates to the Appendix IV BTVs are necessary. In accordance with the Unified Guidance (U.S. EPA, 2009) and CCR Rule (40 C.F.R. § 257.93(f)(3)), the FCPP SDAWP (WSP, 2023) identifies the upper tolerance limit (UTL) method as the prescribed approach for establishing BTVs for assessment monitoring. The advantage of selecting the UTL method is its ability to serve as a single-sample statistical comparison. The statistical hypothesis structure for a single-sample comparison is reversible, such that the same fixed background level can be used for assessment monitoring and later for corrective action comparison testing, if necessary. The UTL tests are applicable for analytes that exhibit non-detectable frequencies of less than 100%.

The U.S. EPA's Unified Guidance (2009) and the FCPP SDAWP (WSP, 2023) promotes the use of the Double Quantification Rule (DQR) to calculate the UTL in cases where the background non-detection frequency is equal to 100%.

The following section describes the statistical methods used to update the Multiunit BTVs.

3.1 EDA Workflow Procedures

EDA is a data diagnostic step that generates qualitative and quantitative information necessary to select a defensible statistical method to determine if there is a SSI over the GWPS. Figure 1 generalizes the EDA workflow, including assessment of spatial heterogeneity, trend detection, data distribution assessment, and outlier detection. Sample number, monitoring well network configuration, sampling frequency and non-detect frequency determine which EDA methods are most useful. The final EDA step is selecting an adequate and appropriate statistical method. Notably, the EDA workflow procedure is standard between detection monitoring and assessment monitoring.

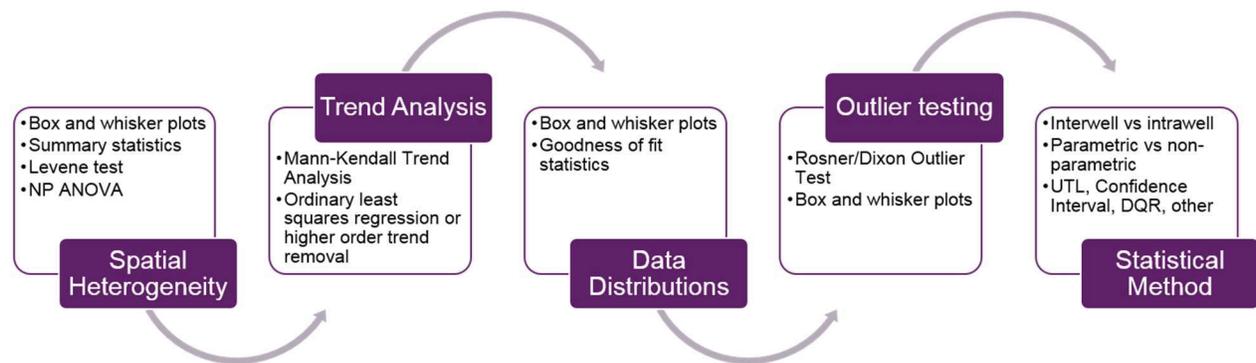

Figure 1. Assessment monitoring EDA and statistical method workflow procedures. Each box represent as separate step in the EDA workflow process. The items listed in each box identifies the statistical method(s) applied for each step. Both quantitative and qualitative methods are listed.

There are a number of different types of tolerance limit and confidence interval quantification methods to select from, depending on the statistical distribution, the presence of a temporal trend, the type of statistical comparison (e.g. interwell or intrawell) and the quantity of non-detect values in the background sample data. The following subsections describe these methods and criteria for their selection.

Non-detect values can introduce subjective uncertainty into the trend analysis, mainly through changes in the reporting limits over time since they are often substituted as the sample analytical value. To avoid this subjective uncertainty, constituents with a non-detect frequency greater than 50% were excluded from the trend analysis.

3.2 Establishing Background Threshold Values

As stated in Section 1.0, BTVs can serve as the GWPS, if appropriate. For this reason, the BTVs were updated as part of this statistical evaluation. Four statistical tests are applicable for updating BTVs for Appendix IV constituents at the FCPP: the parametric interwell upper tolerance limit, the parametric interwell upper tolerance limit with a trend, non-parametric interwell upper tolerance limit and the Double Quantification Rule. This work assumes that background well locations are adequate and thereby declare interwell comparisons appropriate. Each statistical test is described below.

3.2.1 Parametric Interwell Upper Tolerance Limit (P-UTL)

An interwell UTL represents an upper boundary, or threshold concentration value, that contains a pre-specified proportion, or coverage, of the underlying groundwater statistical population. For example, this coverage can range from 95% to 99% of all possible sample measurements in the underlying background statistical population, depending on the data characteristics. Because the monitoring program cannot sample everywhere, there is inherent uncertainty in defining the true underlying statistical population. For this reason, statistical confidence in this coverage is incorporated into the UTL equation using a tolerance coefficient (U.S. EPA, 2009). Oftentimes a tolerance coefficient of at least 95% is used, which corresponds to a significance level (α) equal to 5% (U.S. EPA, 2009). Table 17-3 within the Unified Guidance (U.S. EPA, 2009) combines the coverage and confidence to calculate the UTL.

A parametric interwell upper tolerance limit (P-UTL) is an adequate method if the background sample data met the following criteria, which are tested using procedures declared in the SDAWP (WSP, 2023):

1. Temporal stationarity (no trend in concentration through time)
2. Normal or transformed normal data distribution
3. Spatial heterogeneity is minimal
4. Sample outliers have been removed
5. Sample data are statistically independent and identically distributed

The P-UTLs were calculated using a 95% coverage with a 95% confidence.

The UTL coverage assumes the background sample data set is adequate and representative of intrinsic spatial and temporal variability in groundwater constituent concentrations beneath the Multiunit for Appendix IV constituents. Factors that can violate this assumption include: 1) background wells completed in a different water-bearing unit than compliance wells (i.e., spatial heterogeneity), 2) background wells that have not been sampled during times of extreme potentiometric level (e.g., drought, etc.), and 3) structurally-compromised wells that do not produce representative groundwater samples. Reference to the conceptual site model and professional judgement/interpretation are necessary to confirm the adequacy of background well designations for this statistical evaluation.

Table 1 lists background analytes and wells that are subject to the P-UTL method.

3.2.2 Non-Parametric Interwell Upper Tolerance Limit (NP-UTL)

A non-parametric interwell tolerance limit (NP-UTL) was calculated if the upgradient sample data met the following diagnostic criteria:

1. Temporal stationarity
2. No discernable data distribution
3. Spatial heterogeneity is minimal
4. Sample outliers have been removed
5. Statistical independence

Criterion Number 2, where a parametric distribution is not discernable from the sample data, primarily drives the NP-UTL selection. A NP-UTL uses the first or second highest-ranked background concentration value to establish the UTL, depending on the number of data points. "Ranked" means the grouped background concentration values are ordered in decreasing order and assigned a rank based on this order, where a rank equal to one represents the maximum concentration value. Table 17-4 in the Unified Guidance (U.S. EPA, 2009) provides minimum coverage levels for the first and second ordered sample values with 95% confidence for different background sample numbers. Table 17-4 illustrates that the sample number controls the coverage for the NP-UTL and higher sample numbers are necessary to achieve a higher coverage. Overall, the non-parametric tolerance limit is less powerful in comparison to its parametric counterparts (but more appropriate when parametric assumptions are not met).

The NP-UTL uses the maximum ranked value in the background well, which can constitute a reporting limit value if the reporting limit is higher than detectable concentrations.

Table 1 lists background analytes and wells that are subject to the NP-UTL method.

3.2.3 Calculating the Trend-Dependent Upper Tolerance Limit (P-UTLT)

The threshold limit tests are sensitive to temporal trends, which can inflate the standard deviation that unduly increases the UTL. If the temporal Mann-Kendall trend was significant ($p < 0.05$), and the data exhibit a parametric distribution, the 95% upper tolerance limit was calculated around the temporal trend (P-LCLT). If a trend was significant ($p < 0.05$) but the data distribution was non-parametric, then a NP-LCL was calculated. The P-LCLT was calculated in ProUCL 5.1 using the ordinary least squares (OLS) module and applying the UTL calculation to the time series data, which incorporates the use of Tables 16-1 and 17-3 in the Unified Guidance (US EPA, 2009) to determine the Student's t statistic and k value, respectively.

The P-UTLTs were calculated using a 95% coverage with a 95% confidence.

Table 1 lists background analytes and wells that are subject to the P-UTLT method.

3.2.4 Double Quantification Rule

The DQR is appropriate when the analyte exhibits 100% non-detectable concentrations in the background data set. The DQR states that, for any given compliance well analyte, two consecutive detectable concentrations that are above the maximum reporting limit are sufficient evidence to declare an SSI.

It should be noted that implications exist when there are inconsistencies in reporting limit values over time and between monitoring wells. For example, when the downgradient wells reflect a higher maximum reporting limit in comparison to the background well, applying the DQR leads to uncertainty in identifying a real SSI (i.e., the statistical test results in a false negative SSI). In other cases, it is possible to have lower reporting limit values in downgradient wells, resulting in higher detections, which can trigger a false positive SSI. For these reasons, it is highly recommended that the laboratory establishes achievable and consistent analytical reporting limit values among all wells throughout the duration of the monitoring program.

Table 1 lists background analytes and wells that subject to the DQR.

3.2.5 BTV Updates

The BTV updates are completed in accordance with Section 8 and Section 2.5.2 of the FCPP SDAWP.

4.0 Results

Appendix B summarizes the results of the EDA of the Appendix IV groundwater data.

Table 1 summarizes the GWPS selection for each Appendix IV constituent. The GWPS constitutes either: 1) the statistically calculated BTV, 2) the U.S. EPA's promulgated MCL, or 3) the risk-based alternative GWPS identified for constituents without MCLs, whichever value is higher. This round of BTV updates resulted in the GWPS changing from the calculated BTV to the US EPA MCL or the Alternative Risk-Based GWPS, whichever is relevant, for antimony, cobalt, fluoride, and thallium. For molybdenum, the updated BTV is

equal to the Alternative Risk-Based GWPS, making both equally relevant. For lithium, the BTV remains as the GWPS and decreased from 1.8 milligrams per liter to 1.54 milligrams per liter. For selenium, the BTV remains as the GWPS increased from 0.017 milligrams per liter to 0.12 milligrams per liter.

This BTV update supports previous findings of spatial heterogeneity within the grouped background wells (MW-49A and MW-74) for lithium and selenium, as initially defined in a 2018 CCR Groundwater Assessment Monitoring Report for the Multiunit (Wood, 2018). In response to the 2018 CCR Groundwater Assessment Monitoring Report (Wood, 2018), a preliminary investigation into the BTV calculation for lithium and selenium ensued in August 2022 (Geosciences Consulting Strategies, LLC, 2022), where BTVs for lithium and selenium were evaluated using sample data from each background well (i.e., MW-49A and MW-74), respectively. The 2022 preliminary investigation was completed, in part, to demonstrate a proof of concept for a single well BTV calculation and to help facilitate an appropriate BTV selection. The BTVs resulting from the 2022 preliminary investigation were equal to 0.19 milligrams per liter for selenium using sample data from M-74 and 1.53 milligrams per liter for lithium using sample data from MW-49A. The 2022 preliminary investigation did not declare a well designation for establishing BTVs for lithium and selenium at the Multiunit (see Section 5.0 for further discussion). The BTVs using pooled data from MW-49A and MW-74 from this evaluation, as shown in Table 1, for lithium and selenium, respectively, are of the same order of magnitude, but generally lower, in comparison to the respective BTVs produced during the 2022 preliminary investigation. This is because the background well concentrations used in MW-49A (for selenium) and M-74 (for lithium) are significantly higher and thereby dominate in establishing the respective BTVs when pooling the two background wells' data together. The pooling of background data, however, likely bias the BTVs for these constituents low due to the presence of significantly lower constituent concentrations from the other background well (i.e., MW-49A in the case of lithium and MW-74 in the case of selenium).

5.0 Recommendations

The FCPP SDAWP (WSP, 2023) suggests that MW-49A is suspect to contamination based on its proximity to the Multiunit. This requires further address to determine if current background well designations are appropriate for the Multiunit. If MW-49A is deemed susceptible to contamination from the Multiunit, this background well should be removed from consideration when calculating BTVs for the Multiunit.

The pooling of background data is not recommended in cases where spatial heterogeneity exists, which remains the case for lithium and selenium. Based on the results from this round of BTV updates for the Multiunit, the recommendation made on page 8 in the 2018 Technical Memorandum (Wood, 2018), which was reiterated later in Section 4.0 of the 2022 Preliminary Assessment (Geosciences Consulting Strategies, LLC, 2022), stating "reference to the conceptual site model and professional judgement/interpretation are necessary to confirm adequacy and representativeness of background well designations for Multiunit 1.", still stands. Factors such as groundwater geochemistry, groundwater flow regimes and nearby alternative sources need consideration when selecting an adequate and representative background well designation at the Multiunit for selenium and lithium; this designation should be made before future BTV updates are made for the Multiunit.

The laboratory should achieve reporting limits below the U.S. EPA's promulgated MCLs and maintain a constant reporting limit for each analyte over time for all monitoring wells – background and compliance. This recommendation will improve the certainty of detection of temporal trends in the groundwater sample data while also decreasing the probability for declaring a false negative or false positive SSIs when applying statistical tests, especially the DQR.

Re: CCR GROUNDWATER ASSESSMENT MONITORING
STATISTICAL ANALYSIS AND RESULTS FOR THE CWTP
APPENDIX IV CONSTITUENT DATA COLLECTED THROUGH NOVEMBER 2023
Arizona Public Service Company Four Corners Power Plant - Fruitland, New Mexico

1.0 INTRODUCTION

This Technical Memorandum presents the results of a statistical evaluation of groundwater monitoring data collected from monitoring wells downgradient of the Combined Waste Treatment Pond (CWTP) located at the Arizona Public Service Company (APS) Four Corners Power Plant (Site) in Fruitland, New Mexico. The statistical evaluation was performed by Geosciences Consulting Strategies, LLC (Geosciences Consulting), a subcontractor to WSP USA Environment and Infrastructure, Inc. (WSP) pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (CCR Rule) (Federal Register, 2020).

The statistical analysis documented herein presents an evaluation of assessment monitoring (i.e., Appendix IV constituent) groundwater data collected from the CWTP to date. Statistically significant increases (SSIs) over background concentrations were declared on April 10, 2023 at CWTP monitoring well, MW-62 for two detection monitoring constituents (boron and calcium). CWTP downgradient compliance wells include MW-62, MW-63, MW-64, and MW-65 and CWTP background wells include MW-71, MW-72, and MW-73 during the November 2023 assessment monitoring sampling event.

2.0 STATISTICAL EVALUATION RESULTS

Attachment A presents the initial statistical evaluation of Appendix IV constituents performed by Geosciences Consulting. The results of the evaluation are summarized as follows:

- Table 1 of Attachment A summarizes the groundwater protection standard (GWPS) selection for each Appendix IV constituent. Table 2 of Attachment A summarizes the lower confidence level (LCL) value for each constituent in each well, if the LCL value exceeds its respective GWPS, statistically significant temporal trends, and the type of LCL test applied.
- The statistical evaluation indicates there is insufficient evidence to declare statistically significant levels (SSLs) in Appendix IV constituent concentrations above respective GWPSs at the CWTP.
- Several compliance monitoring wells exhibit statistically significant ($p < 0.05$) temporal trends as follows:

- Increasing temporal trends were noted at downgradient wells MW-62 for arsenic and at MW-65 for barium and cobalt.
- Decreasing temporal trends were noted at downgradient wells MW-62 for barium and molybdenum, MW-63 for cobalt, and MW-65 for fluoride.

3.0 RECOMMENDATIONS

Based on the results of the statistical evaluation presented in Attachment A and pursuant to the CCR Rule, there are currently no GWPS exceedances or exceedances of respective background threshold values in Appendix IV constituent concentrations based on evaluation of the groundwater monitoring data collected in November 2023. There are currently no SSLs for Appendix IV constituents above their respective GWPSs.

Based on the statistical evaluation presented in Attachment A and pursuant to the CCR Rule, the CWTP should remain in assessment monitoring until criteria under §257.95(e) of the CCR Rule are met (Federal Register, 2020). It is recommended to resample a compliance well if mercury is detected in the well. If the resample event results in a detectable concentration, there is sufficient evidence to declare a SSL above the GWPS. WSP recommends performing continued trend testing after each monitoring event and updates to the BTVs after 1-2 years of future sampling events.

Date: April 8, 2024

**Subject: CCR Groundwater Assessment Monitoring
Statistical Evaluation of CWTP Data through November 2023
Arizona Public Service Company Four Corners Power Plant – Fruitland, New Mexico**

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) documents the statistical evaluation of assessment monitoring (i.e., Appendix IV constituents) groundwater data associated with the Combined Waste Treatment Pond (CWTP) unit located at the Arizona Public Service Company (APS) Four Corners Power Plant (FCPP) in Fruitland, New Mexico. This statistical evaluation is completed by Geoscience Consulting Strategies LLC in accordance with the Statistical Data Analysis Work Plan (SDAWP) for the FCPP and the Coal Combustion Residuals (CCR) Rule (Federal Register, 2020; WSP USA Environment & Infrastructure Inc (WSP), 2023).

On 10 April 2023 APS declared a statistically significant increase for two detection monitoring (i.e., Appendix III) constituents (boron and calcium) at the CWTP. Per the CCR Rule, within 90 days of this declaration APS initiated an assessment monitoring program for the CWTP.

This statistical evaluation incorporates the November 2023 semiannual assessment monitoring at the CWTP. The following sections present data inputs, statistical methods, results and recommendations for the subject analysis.

2.0 DATA INPUTS

The CWTP groundwater monitoring well network consists of three background monitoring wells (MW-71, MW-72, and MW-73) and four compliance (i.e., downgradient) monitoring wells (MW-62, MW-63, MW-64 and MW-65). The period of evaluation for the CWTP Appendix IV constituent statistical analysis ranges from November 2015 through November 2023 and includes the minimum of eight initial, or baseline, sampling rounds required by the CCR Rule and seven subsequent sampling rounds for Appendix IV groundwater constituents that occur on a semi-annual frequency (spanning from October 2017 to November 2023, as shown in the table inset below). Due principally to the CCR Rule requirement that a minimum of eight initial rounds of data be collected from the site prior to October 17, 2017, the frequency of sample collection prior to this date is short and variable (e.g., biweekly to quarterly sampling).

| CWTP Appendix IV Sampling Round | Date |
|---------------------------------|---------------|
| 1 st | October 2017 |
| 2 nd | April 2021 |
| 3 rd | November 2021 |
| 4 th | May 2022 |
| 5 th | November 2022 |
| 6 th | May/June 2023 |
| 7 th | November 2023 |

Depending on the Appendix IV constituent, the minimal sample numbers in this statistical evaluation ranges between 21 to 32. Appendix A contains the sample data for the subject analysis. Data inputs for this statistical analysis were prepared, and provided by, WSP. The Appendix IV analytes are listed by name or chemical symbol as column headers in the ProUCL data upload table. By ProUCL convention, each analyte has a corresponding data column (indicated with a "D_" prefix) that indicates if the analyte was detected or not at a concentration that exceeds the analytical reporting limit, where detectable concentrations are symbolized by a "1" and non-detectable concentrations are symbolized by a "0."

3.0 METHODS

The methods applied in this statistical analysis were performed in accordance with the Four Corners SDAWP (WSP, 2023a) and the Groundwater Protection Standards (GWPSs) established in October 2023 (WSP, 2023b). Table 1 summarizes the GWPSs for the CWTP Appendix IV constituents and their respective method of calculation. The GWPS constitutes either: 1) the statistically calculated BTV, 2) the U.S. EPA's promulgated Maximum Contaminant Level (MCL) (40 CFR. Part 141), or 3) the risk-based alternative GWPS identified for constituents without MCLs (40 CFR 257.95(h)(2)), whichever value is highest.

Assessment monitoring, unlike detection monitoring, does not compare individual sample observations to a GWPS. To determine CWTP compliance under assessment monitoring, the Appendix IV sample data from downgradient compliance wells are statistically compared to respective GWPSs using confidence intervals. Confidence intervals are a recommended approach for comparing compliance well (i.e., downgradient) data to a GWPS during assessment monitoring or corrective action (U.S. EPA, 2009). In this case, the central tendency of the sample population is the parameter of interest, consisting of the mean or median. The confidence interval surrounding the central tendency accounts for both the level of statistical variation in the data and the desired confidence level. For this statistical analysis, the lower limit of the confidence interval is the parameter of interest and reflects the lowest concentration boundary beyond which the true central tendency of the downgradient sample data is not expected to reside. The lower confidence limit (LCL) for each Appendix IV constituent is compared to its respective GWPS to assess if the lower limit exceeds the GWPS and, if so, declares constituent concentrations at a statistically significant level (SSL) above the GWPS.

In cases where the background non-detection frequency is equal to 100% (e.g., mercury at the CWTP), the U.S. EPA's Unified Guidance (2009) and the SDAWP (WSP, 2023a) promote the use of the Double Quantification Rule (DQR). The DQR is appropriate when the analyte exhibits 100% non-detectable concentrations in the background data set. The DQR states that, for any given compliance well analyte, two consecutive detectable concentrations that are above the maximum reporting limit are sufficient evidence to declare an SSL.

Each compliance well analyte underwent Exploratory Data Analysis (EDA) to assess the sample data for outliers and statistically significant ($p < 0.05$) increasing or decreasing temporal trends. The EDA process also identified which statistical distribution the sample data best fit to select an appropriate statistical comparison (e.g. parametric versus non-parametric) to the GWPS (WSP, 2023).

Results from this statistical evaluation are discussed below.

4.0 Results

Table 2 summarizes: 1) the LCL value for each constituent in each well, 2) which compliance wells exhibit statistically significant temporal trends and 3) the type of LCL test applied

This statistical evaluation indicates there is insufficient evidence to declare Appendix IV concentrations observed at the CWTP are above their respective GWPS at SSLs.

Several compliance monitoring wells exhibit statistically significant ($p < 0.05$) temporal trends when incorporating the November 2023 data. Arsenic (MW-62), barium (MW-65) and cobalt (MW-65) demonstrate statistically significant ($p < 0.05$) increasing trends during the November 2023 sampling period. Barium (MW-62), cobalt (MW-63), fluoride (MW-65) and molybdenum (MW-62) demonstrate statistically significant ($p < 0.05$) decreasing trends.

5.0 Recommendations

Based on the results of this statistical analysis, the CWTP should remain in assessment monitoring until criteria under §257.95(e) of the CCR Rule are met. Further, mercury is a constituent subject to the DQR. The DQR requires resampling in the case a sample concentration is detected in a compliance well. It is recommended to resample a compliance well if mercury is detected in the well. The resample event should be consecutive to the sample event that produced the detectable concentration and before the next scheduled monitoring event. If the resample event results in a detectable concentration, there is sufficient evidence to declare a SSL above the GWPS.

| MW-71, MW-72, MW-73 | Combined Radium | 5 | --- | 4.16 (P-UTL) | pCi/L | US EPA MCL |

Notes:

BTV = Background Threshold Value

GWPS = Groundwater Protection Standard

US EPA MCL = United States Environmental Protection Agency Maximum Contaminant Level under the Safe Drinking Water Act

¹ Double Quantification Rule (DQR), Parametric Upper Tolerance Limit (P-UTL), Non-Parametric Upper Tolerance Limit (NP-UTL), Parametric Upper Tolerance Limit with a trend (P-UTLT)

² The DQR BTV represents the maximum reporting limit value

³ Background Threshold Values were updated in September 2023.

⁴ The GWPS selection represents the highest value between the US EPA MCL, the Alternative Risk-Based GWPS and the BTV

Re: CCR GROUNDWATER ASSESSMENT MONITORING
STATISTICAL ANALYSIS AND RESULTS FOR THE CWTP
APPENDIX IV CONSTITUENT DATA COLLECTED THROUGH MAY 2024
Arizona Public Service Company Four Corners Power Plant - Fruitland, New Mexico

1.0 INTRODUCTION

This Technical Memorandum presents the results of a statistical evaluation of groundwater monitoring data collected from monitoring wells downgradient of the Combined Waste Treatment Pond (CWTP) located at the Arizona Public Service Company (APS) Four Corners Power Plant (Site) in Fruitland, New Mexico. The statistical evaluation was performed by Geosciences Consulting Strategies, LLC (Geosciences Consulting), a subcontractor to WSP USA Environment and Infrastructure, Inc. (WSP) pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (CCR Rule) (Federal Register, 2020).

The statistical analysis documented herein presents an evaluation of assessment monitoring (i.e., Appendix IV constituent) groundwater data collected from the CWTP to date. Statistically significant increases (SSIs) over background concentrations were declared on April 10, 2023 at CWTP monitoring well, MW-62 for two detection monitoring constituents (boron and calcium). CWTP downgradient compliance wells include MW-62, MW-63, MW-64, and MW-65 and CWTP background wells include MW-71, MW-72, and MW-73 during the May 2024 semi-annual sampling event. The statistical evaluation was performed using the results of 8 subsequent semi-annual sampling rounds conducted from October 2017 to May 2024 (Attachment A). Groundwater concentrations are then compared to the CWTP's groundwater protection standards (GWPSs) established in the October 2023 CWTP statistical evaluation (WSP, 2023c). Details of the results of the statistical evaluation are presented in Section 2.0.

2.0 STATISTICAL EVALUATION RESULTS

Attachment A presents the statistical evaluation of Appendix IV constituents performed by Geosciences Consulting. The results of the evaluation are summarized as follows:

- This statistical evaluation indicates there is insufficient evidence to declare statistically significant levels (SSLs) in Appendix IV constituent concentrations above respective GWPSs at the CWTP.
- The antimony laboratory reporting limit (RL) during the May 2024 sampling event was elevated at a concentration of less than (<) 0.01 mg/L which is above the GWPS of 0.006 mg/L.

- Several compliance monitoring wells exhibit statistically significant ($p < 0.05$) temporal trends as follows:
 - Increasing temporal trends are evident at downgradient wells MW-62 for detections of arsenic and at MW-65 for detections of barium and cobalt.
 - Decreasing temporal trends are evident at downgradient wells MW-62 for detections of barium and molybdenum, MW-63 for detections of cobalt, MW-64 for detections of barium and molybdenum, and MW-65 for detections of fluoride and molybdenum.

3.0 RECOMMENDATIONS

Based on the statistical evaluation presented in Attachment A and pursuant to the CCR Rule, the CWTP should remain in assessment monitoring until criteria under §257.95(e) of the CCR Rule are met (Federal Register, 2020).

In light of the number of recent occurrences of laboratory sample dilutions and elevated reporting limits for other CCR units (WSP, 2023b and WSP, 2024), WSP recommends verifying all reporting limits (RLs) upon sampling receipt for future monitoring events. If the appropriate RL can not be met, re-analysis or re-sampling may be necessary. All RLs need to be at or below the respective GWPSs. If the laboratory can not meet the required detection limit (e.g; the RL) and the result is reported as non-detect; then the detection limit is evaluated during the statistical analysis to determine if it is an outlier within the dataset. The statistical evaluation requires consistency when comparing non-detect values. Changes in detection limits are evaluated on a case by case basis and if the detection limit is continually required as the limit of detection to achieve analyte concentrations at or below the GWPS, then the GWPS determination will be reevaluated to ensure the GWPS is set at the appropriate value based on the changes in the laboratory detection limit. This re-evaluation will support that the laboratory can effectively achieve detection limits at or below the GWPS in cases where the sample is not detected and the GWPS is set at the detection limit where no United States Environmental Protection Agency (US EPA) maximum contaminant level (MCL) is established.

WSP recommends performing continued trend testing after each monitoring event and updates to the BTVs every 2 to 3 years.

Subject: **CCR Groundwater Assessment Monitoring
Statistical Evaluation of CWTP Data through May 2024
Arizona Public Service Company Four Corners Power Plant – Fruitland, New Mexico**

1.0 INTRODUCTION

This Technical Memorandum (Tech Memo) documents the statistical evaluation of assessment monitoring (i.e., Appendix IV constituents) groundwater data associated with the Combined Waste Treatment Pond (CWTP) unit located at the Arizona Public Service Company (APS) Four Corners Power Plant (FCPP) in Fruitland, New Mexico. This statistical evaluation is completed by Geoscience Consulting Strategies LLC in accordance with the Statistical Data Analysis Work Plan (SDAWP) for the FCPP and the Coal Combustion Residuals (CCR) Rule (Federal Register, 2020; WSP USA Environment & Infrastructure Inc (WSP), 2023a).

On 10 April 2023 APS declared a statistically significant increase for two detection monitoring (i.e., Appendix III) constituents (boron and calcium) at the CWTP. Per the CCR Rule, within 90 days of this declaration APS initiated an assessment monitoring program for the CWTP.

This statistical evaluation incorporates the May 2024 semiannual assessment monitoring at the CWTP. The following sections present data inputs, statistical methods, results and recommendations for the subject analysis.

2.0 DATA INPUTS

The CWTP groundwater monitoring well network consists of three background monitoring wells (MW-71, MW-72, and MW-73) and four compliance (i.e., downgradient) monitoring wells (MW-62, MW-63, MW-64 and MW-65). The period of evaluation for the CWTP Appendix IV constituent statistical analysis ranges from November 2015 through May 2024 and includes the minimum of eight initial, or baseline, sampling rounds required by the CCR Rule and eight subsequent sampling rounds for Appendix IV groundwater constituents that occur on a semi-annual frequency (spanning from October 2017 to May 2024, as shown in the table inset below). Due principally to the CCR Rule requirement that a minimum of eight initial rounds of data be collected from the site prior to October 17, 2017, the frequency of sample collection prior to this date is short and variable (e.g., biweekly to quarterly sampling).

| CWTP Appendix IV Sampling Round | Date |
|---------------------------------|---------------|
| 1 st | October 2017 |
| 2 nd | April 2021 |
| 3 rd | November 2021 |
| 4 th | May 2022 |
| 5 th | November 2022 |
| 6 th | May/June 2023 |
| 7 th | November 2023 |
| 8 th | May 2024 |

Depending on the Appendix IV constituent, the minimal sample numbers in this statistical evaluation ranges between 22 to 33. Appendix A contains the sample data for the subject analysis. Data inputs for this statistical analysis were prepared, and provided by, WSP. The Appendix IV analytes are listed by name or chemical symbol as column headers in the ProUCL data upload table. By ProUCL convention, each analyte has a corresponding data column (indicated with a "D_" prefix) that indicates if the analyte was detected or not at a concentration that exceeds the analytical reporting limit, where detectable concentrations are symbolized by a "1" and non-detectable concentrations are symbolized by a "0."

3.0 METHODS

The methods applied in this statistical analysis were performed in accordance with the Four Corners SDAWP (WSP, 2023a) and the Groundwater Protection Standards (GWPSs) established in October 2023 (WSP, 2023b). Table 1 summarizes the GWPSs for the CWTP Appendix IV constituents and their respective method of calculation. The GWPS constitutes either: 1) the statistically calculated BTV, 2) the U.S. EPA's promulgated Maximum Contaminant Level (MCL) (40 CFR, Part 141), or 3) the risk-based alternative GWPS identified for constituents without MCLs (40 CFR 257.95(h)(2)), whichever value is highest.

Assessment monitoring, unlike detection monitoring, does not compare individual sample observations to a GWPS. To determine CWTP compliance under assessment monitoring, the Appendix IV sample data from downgradient compliance wells are statistically compared to respective GWPSs using confidence intervals. Confidence intervals are a recommended approach for comparing compliance well (i.e., downgradient) data to a GWPS during assessment monitoring or corrective action (U.S. EPA, 2009). In this case, the central tendency of the sample population is the parameter of interest, consisting of the mean or median. The confidence interval surrounding the central tendency accounts for both the level of statistical variation in the data and the desired confidence level. For this statistical analysis, the lower limit of the confidence interval is the parameter of interest and reflects the lowest concentration boundary beyond which the true central tendency of the downgradient sample data is not expected to reside. The lower confidence limit (LCL) for each Appendix IV constituent is compared to its respective GWPS to assess if the lower limit exceeds the GWPS and, if so, declares constituent concentrations at a statistically significant level (SSL) above the GWPS.

In cases where the background non-detection frequency is equal to 100% (e.g., mercury at the CWTP), the U.S. EPA's Unified Guidance (2009) and the SDAWP (WSP, 2023a) promote the use of the Double Quantification Rule (DQR). The DQR is appropriate when the analyte exhibits 100% non-detectable concentrations in the background data set. The DQR states that, for any given compliance well analyte, two consecutive detectable concentrations that are above the maximum reporting limit are sufficient evidence to declare an SSL.

Each compliance well analyte underwent Exploratory Data Analysis (EDA) to assess the sample data for outliers and statistically significant ($p < 0.05$) increasing or decreasing temporal trends. The EDA process also identified which statistical distribution the sample data best fit to select an appropriate statistical comparison (e.g. parametric versus non-parametric) to the GWPS (WSP, 2023a).

Results from this statistical evaluation are discussed below.

4.0 Results

Table 2 summarizes: 1) the LCL value for each constituent in each well, 2) which compliance wells exhibit statistically significant temporal trends and 3) the type of LCL test applied

This statistical evaluation indicates there is insufficient evidence to declare Appendix IV concentrations observed at the CWTP are above their respective GWPS at SSLs.

Several compliance monitoring wells exhibit statistically significant ($p < 0.05$) temporal trends when incorporating the May 2024 data. Arsenic (MW-62), barium (MW-65) and cobalt (MW-65) demonstrate statistically significant ($p < 0.05$) increasing trends during the May 2024 sampling period.

Notably, arsenic concentrations in MW-62 have increased to concentrations near, but not exceeding, the GWPS of 0.013 mg/L in the five most recent sampling events. Barium (MW-62), cobalt (MW-63), fluoride (MW-64 and MW-65) and molybdenum (MW-62, MW-64 and MW-65) demonstrate statistically significant ($p < 0.05$) decreasing trends.

5.0 Recommendations

Based on the results of this statistical analysis, the CWTP should remain in assessment monitoring until criteria under §257.95(e) of the CCR Rule are met. When the criteria under §257.95(e) are met, the CWTP can return to detection monitoring. While criteria have been met under §257.95(e) for most Appendix IV constituents, the reporting limit for antimony did exceed the GWPS for this constituent for the May 2024 sampling event. No reporting limit should exceed respective GWPSs.

Further, mercury is a constituent subject to the DQR. Because mercury has generally been reported with concentrations below the detection limit, the DQR requires resampling in the case a sample concentration is detected in a compliance well. It is recommended to resample a compliance well if mercury is detected in the well. The resample event should follow the sample event that produced the detectable concentration and before the next scheduled monitoring event. The Unified Guidance (US EPA, 2009) suggests resampling within 1-2 months following the detected concentration and it is recommended to resample as soon as possible within this timeframe. If the resample event results in a detectable concentration, there is sufficient evidence to declare a SSL above the GWPS.

Finally, when submitting future ProUCL data upload tables (i.e., Appendix A), it is recommended to describe if the reporting limit or method detection limit is used to define the detection status of a sample result and

define the value of this limit. Changing the method of determining “detection limit” may affect the resulting statistical analysis and BTV determination.

Legend

| | |
|--------------|--|
| Method (LCL) | There is insufficient evidence to declare an SSI over the GWPS |
| Method (LCL) | Statistically significant increasing trend (p<0.05) |
| Method (LCL) | Statistically significant decreasing trend (p<0.05) |
| Method (LCL) | There is sufficient evidence to declare an SSI over the GWPS |

| | |
|---------------|--|
| NP-LCL | Non-Parametric Lower Confidence Limit |
| P-LCLT | Parametric Lower Confidence Limit with a Trend |
| P-LCL | Parametric Lower Confidence Limit |
| GWPS | Groundwater Protection Standard |
| mg/L | milligrams per liter |
| pCi/L | picocuries per liter |

| Full Precision | OFF | | | | | | |
| Dixon's Outlier Test for Antimony (mw-62) | | | | | | | |
| Number of Observations = 22 | | | | | | | |
| 10% critical value: 0.382 | | | | | | | |
| 5% critical value: 0.43 | | | | | | | |
| 1% critical value: 0.514 | | | | | | | |
| 1. Observation Value 0.01 is a Potential Outlier (Upper Tail)? | | | | | | | |
| Test Statistic: 0.667 | | | | | | | |
| For 10% significance level, 0.01 is an outlier. | | | | | | | |
| For 5% significance level, 0.01 is an outlier. | | | | | | | |
| For 1% significance level, 0.01 is an outlier. | | | | | | | |
| 2. Observation Value 0.00011 is a Potential Outlier (Lower Tail)? | | | | | | | |
| Test Statistic: 0.229 | | | | | | | |
| For 10% significance level, 0.00011 is not an outlier. | | | | | | | |
| For 5% significance level, 0.00011 is not an outlier. | | | | | | | |
| For 1% significance level, 0.00011 is not an outlier. | | | | | | | |
| Dixon's Outlier Test for Antimony (mw-63) | | | | | | | |
| Number of Observations = 22 | | | | | | | |
| 10% critical value: 0.382 | | | | | | | |
| 5% critical value: 0.43 | | | | | | | |
| 1% critical value: 0.514 | | | | | | | |
| 1. Observation Value 0.01 is a Potential Outlier (Upper Tail)? | | | | | | | |

M

SEMI-ANNUAL REPORT
DOCUMENTING PROGRESS ON
REMEDY SELECTION
MULTIUNIT 1 AND THE UPPER
RETENTION SUMP

July 15, 2024

Arizona Public Service Company
400 N. 5th Street
Phoenix, Arizona 85004

**Subject: Semiannual Report Documenting Progress In Remedy Selection
Multiunit 1 And Upper Retention Sump
Four Corners Power Plant - Fruitland, New Mexico**

In accordance with 40 Code of Federal Regulations (CFR) Section (§) 257.97(a) of the Coal Combustion Residuals (CCR) Rule, this Semiannual Remedy Selection Progress Report (Semiannual Report) has been prepared on behalf of Arizona Public Service Company (APS) to document progress in selection of remedies for CCR units which have been identified as potentially impacting groundwater at the APS Four Corners Power Plant, located in Fruitland, New Mexico (the Site). Applicable Site CCR units include Multiunit 1 (comprised of the Lined Ash Impoundment [LAI] and the Lined Decant Water Pond [LDWP]) and the Upper Retention Sump (URS). Semiannual progress reporting to support remedy selection began on July 15, 2019. The most recent update was provided in the *Annual Groundwater Monitoring and Corrective Action Report (GMCAR) for 2023*, dated January 31, 2024. This Semiannual Report serves as the eleventh update on remedy selection progress at the site and documents activities completed to date in 2024.

SUMMARY OF ACTIVITIES COMPLETED IN 2024

Activities completed by APS in the first half of 2024 in support of remedy selection for Multiunit 1 and the URS include the following:

- *Continued Assessment Monitoring at Multiunit 1 and the URS* - While corrective action evaluation progresses, assessment monitoring (including analysis of collected samples for Appendix III and Appendix IV constituents) has continued on a semi-annual basis at the Multiunit 1 and the URS per 40 CFR §257.95(b) and (d)(1).
- *URS-05, URS-06, URS-07, and URS-08 Well Completion Report* - A report documenting field activities, borehole advancement, and the well installation of two extraction wells and two monitoring wells at the URS that will be incorporated into the remedy was completed and will be included in the 2024 GMCAR.
- *Interim Response Measures at the URS* - Startup of groundwater extraction from CM-01 and CM-02 began in February 2022 and APS continued to operate the seepage extraction system throughout the first half of 2024. The extracted groundwater is discharged into a plant sump for reuse in plant operations. A performance evaluation and annual contaminant mass removal estimates from the seepage collection system will be included in the 2024 GMCAR. Additionally, the performance evaluation is expected to be included in the remedy selection report.

- *Interim Response Measures at Multiunit 1* – APS operated the Northern and Southern Intercept Trench throughout the first half of 2024 to intercept and collect seepage from Multiunit 1 and closed surface impoundments. The extracted groundwater is reused in plant operations. Annual contaminant mass removal estimates from the seepage collection system will be calculated and included in the 2024 GMCAR.
- *LAI and LDWP Closure Activities* – Cover system design continued during the first half of 2024. A pilot-test field program to evaluate the extent and removal of drainable pore water in the LAI has also been ongoing since mid-2023. Multiple wells have been installed through the ash, above the base of the liner, with testing performed.
- *Remedy Selection Report for the Multiunit 1 and the URS*. Preparation of a remedy selection report continued through the beginning of 2024 to document how the selected remedy will meet the requirements of 40 CFR §257.97(b).

FUTURE PLANNED ACTIVITIES

APS plans to perform the following activities in support of remedy selection during the second half of 2024 (and in upcoming years, as noted):

- *Continued Operation of the Extraction System at URS*. The extraction well system at URS will continue to serve as part of interim response measures until remedial activities begin. The seepage collection system will also likely be a part of final selected remedy.
- *Continued Operation of the Seepage Collection Systems Downgradient of Multiunit 1*. The seepage intercept system downgradient of Multiunit 1 will continue to serve as part of interim response measures until remedial activities begin. The seepage collection system will also likely be a part of final selected remedy.
- *Preparation of Remedy Selection Report* – APS will select remedies for Multiunit 1 and the URS that meet the requirements of 40 CFR §257.97(b) and document the selection process in a remedy selection report prepared for each unit per 40 CFR §257.97(a).
- *Initiation of Remedial Activities* – Per 40 CFR §257.91(f), remedial activities at Multiunit 1 and the URS will begin within 90 days of selecting a remedy for each unit.

Respectfully submitted,

WSP USA Environment & Infrastructure Inc.
