1 INTRODUCTION

This Annual Groundwater Monitoring and Corrective Action Report for 2024 (Annual Report) was prepared on behalf of Arizona Public Service Company (APS) by WSP USA Inc. (WSP), for the Four Corners Power Plant (FCPP or the Site) located in Fruitland, New Mexico. The Annual Report summarizes groundwater monitoring and corrective action activities conducted in 2024 to support compliance with coal combustion residuals (CCR) groundwater monitoring and corrective action requirements detailed in 40 Code of Federal Regulations (CFR) Part 257 (herein referred to as the CCR Rule) (Federal Register, 2020).

The CCR Rule became effective on October 19, 2015, and established standards for the disposal of CCR in landfills and surface impoundments (CCR units). In particular, the CCR Rule set forth groundwater monitoring and corrective action requirements for CCR units. The CCR Rule includes the requirement that an “annual groundwater monitoring and corrective action report” be prepared by January 31 for the preceding calendar year (the reporting period). This Annual Report prepared for the 2024 calendar year is intended to document the status of the groundwater monitoring and corrective action programs for each CCR unit, summarize key actions completed, and forecast key activities for 2025. APS additionally considers this report to meet the semi-annual reporting requirements of 40 CFR §257.97(a) for selecting and designing remedies pursuant to the CCR Rule during the last half of 2024.

The remainder of Section 1 provides a summary description of the power generating facility, the CCR units present at the facility, the facility’s environmental setting that forms the basis for assessment of underlying groundwater conditions, and an overview of the CCR groundwater monitoring system. Section 2 presents key groundwater monitoring and corrective action activities performed during the reporting period. Sections 3 and 4 summarize in further detail the activities performed for the groundwater monitoring and corrective action programs respectively during the reporting period. Key activities identified for the upcoming year are presented in Section 5.

1.1 SITE BACKGROUND

1.1.1 FACILITY AND CCR UNIT DESCRIPTION

Facility Description. FCPP is an operating power plant owned by APS and four other utilities. The plant burns low sulfur coal in two electrical generating units (Units 4 and 5) and has a net generating capacity of 1,540 megawatts. FCPP formerly had five generating units and a capacity of 2,040 megawatts; Units 1, 2, and 3 were retired in December 2013 and decommissioned between 2014 and 2016. Coal burned at the plant is generally sourced from the nearby Navajo Mine (Navajo Transitional Energy Company, 2025).

Facility Location. The plant and associated infrastructure are located approximately 20 miles southwest of the city of Farmington in the Colorado Plateau physiographic province of northwestern New Mexico (**Figure 1-1**). The land on which the plant resides is leased from the Navajo Nation and is primarily located in Section 36, Township 29 North, and Range 16 West of the northwest quadrant of the New Mexico Principal Meridian and Base Line.

CCR Unit Description. Plant infrastructure includes three single CCR units in the main plant area where the generating units are located (i.e., the Upper Retention Sump [URS], Combined Waste Treatment Pond [CWTP], and Return Water Pond [RWP]) and one single CCR unit (the Dry Fly Ash Disposal Area [DFADA]) and one CCR multiunit (referred to as Multiunit 1 comprised of the Lined Ash Impoundment [LAI] and Lined Decant Water Pond [LDWP]) to the west of the main plant area within the FCPP lease boundary (also known as the disposal area where CCR is currently and has historically been placed) (**Figure 1-2**). **Table 1-1** summarizes the location, function, operation, size/construction, and history of each regulated unit. The boundaries of CCR units depicted in **Figure 1-2** are based on available historical plans for the units.

1.1.2 ENVIRONMENTAL SETTING

Unless otherwise noted, the following information is abstracted from the *CCR Monitoring Well Network Report and Certification* by AECOM Technical Services, Inc. (AECOM, 2017).

Climate. The plant is located in a semi-arid climate on the western flank of the San Juan Basin. The area receives an average of 8.6 inches of precipitation and 12.6 inches of snow per year.

Topography. The main plant area of the FCPP is located at an elevation of approximately 5,340 to 5,360 feet (ft) above mean sea level (amsl). The topography of the FCPP area is characterized by rolling terrain, steep escarpments, and incised drainages/arroyos. In the vicinity of the plant, the ground surface is relatively flat, sloping to the west at approximately 20 ft per mile; however, surface drainage immediately near Morgan Lake flows towards the lake. About one mile west of the plant, the level ground surface drops rapidly to 5,200 ft amsl. Chaco Wash (also known as Chaco River) is located west of the abrupt change in elevation and ephemerally flows north to the San Juan River.

Surface Water Hydrology. FCPP is situated on the southern bank of Morgan Lake, an approximately 1,300-acre manufactured lake that has a maximum storage capacity of 39,000 acre-ft of water and supplies cooling water to the plant. Morgan Lake was formed by damming a westerly flowing stream (now known as 'No Name Wash') and is replenished by an underground pipeline (i.e., aqueduct) that routes flow from the San Juan River located approximately 3 miles north of the FCPP. The typical water surface elevation of the lake is approximately 5,330 ft amsl. Morgan Dam intermittently discharges in accordance with National Pollutant Discharge Elimination System (NPDES) Permit No. NN0000019 to 'No Name Wash,' which flows west of the lake to Chaco Wash.

Site Geology. The San Juan Basin is a structural depression that lies at the eastern edge of the Colorado Plateau (Dames & Moore, 1988). The dominant geographic feature in the vicinity of FCPP is the Hogback Monocline located to the west of Chaco Wash; this monocline is a steep (38 degree) eastward-dipping flank composed of Cretaceous sedimentary rock (Dames & Moore, 1988).

There are two 'uppermost geologic units' that underlie the FCPP Site and immediate vicinity. These units are expected to influence groundwater flow and result in variations in naturally occurring constituent concentrations across the Site. The units are as follows:

- **Pictured Cliffs Sandstone:** The Pictured Cliffs Sandstone is the uppermost geologic unit beneath the plant and the CCR units located in this vicinity (i.e., the URS, the CWTP, and the RWP as depicted in **Figure 1-2**). This unit is a fine- to medium-grained marine sandstone. The lower portions of the Pictured Cliffs Sandstone represent a transitional sequence between this formation and the underlying Lewis Shale as indicated by alternating thin beds of very fine-grained sandstone and silty shale. The Pictured Cliffs Sandstone forms a capstone on an exposed cliff face located between the main plant site and the CCR units located to the west (i.e., LAI, LDWP, and the DFADA).
- **Lewis Shale:** The Lewis Shale is a marine shale that contains evaporite deposits resulting in naturally occurring saline groundwater conditions. The Lewis Shale is the uppermost geologic unit that underlies the LAI, LDWP, and DFADA and spans west of the Pictured Cliffs Sandstone cliff face approximately 1.5 miles westward to the base of the Hogback Monocline. The regional thickness of the Lewis Shale is approximately 500 ft and is underlain by the Cliff House Sandstone. The Lewis Shale consists of a weathered shale subunit overlying a hard, unweathered shale subunit. The thickness of the weathered shale varies between 11 and 47 ft with an average thickness of 30 ft within the vicinity of the Site (Dames & Moore, 1988). The weathered shale is not as thick when overlain by the Pictured Cliffs Sandstone in the vicinity of the plant site. At the RWP, subsurface investigations did not identify weathered Lewis Shale. The unweathered shale below the RWP dips to the northeast, towards Morgan Lake (Wood, 2020a). The Lewis Shale subunit contains thin sandstone lenses that vary in thickness from 1 to 7 ft; the sandstone is fine to very fine grained and cemented by calcium carbonate (Dames & Moore, 1988). The unweathered shale is significantly less permeable than the weathered shale. The unweathered shale is very fine grained to silty and contains periodic siltstone and sandstone lenses (Dames & Moore, 1988). The surface of the unweathered shale slopes towards the Chaco Wash in the disposal area at approximately the same slope as land surface (Dames & Moore, 1988) but displays some irregularity resulting in varying levels of saturated thickness in the weathered shale. The

weathered Lewis Shale is variably saturated and hydraulically interconnected with alluvial deposits of Chaco Wash. The low-permeability unweathered shale underlying the Pictured Cliffs Sandstone results in a perched saturated zone in this region.

Applicable Hydrostratigraphy. Three general hydrostratigraphic units are conceptualized beneath the FCPP and associated CCR units. These units form the basis for the Conceptual Site Model (CSM) developed by AECOM (AECOM, 2017) for the purpose of designing the Site CCR groundwater monitoring system and establishing the working basis for statistically evaluating groundwater conditions underlying the Site.

The first hydrostratigraphic unit (Pictured Cliffs Sandstone) is dominant under the plant area, which is located in an elevated area south of Morgan Lake (**Figure 1-2**). Three CCR units (the URS, CWTP, and RWP) reside within this area. The Pictured Cliffs Sandstone is saturated below the URS and the CWTP and thus serves as the uppermost water-bearing unit for these surface impoundments. While the Pictured Cliffs Sandstone is unsaturated beneath the RWP, this hydrostratigraphic unit is the uppermost water-bearing unit should a leak from the RWP occur (the underlying Unweathered Lewis Shale prevents appreciable vertical migration of groundwater). The Pictured Cliffs Sandstone extends from ground surface (between approximately 5,340 to 5,360 ft amsl) to approximately 5,300 ft amsl in the plant area. Groundwater underlying the URS and CWTP is strongly influenced by Morgan Lake (at a surface elevation of approximately 5,330 ft amsl) and generally flows northward towards the lake. However, construction and operations of the plant have resulted in disturbed ground conditions and associated impacts are not well understood.

The second hydrostratigraphic unit (Weathered Lewis Shale/Alluvium) underlies the Pictured Cliffs Sandstone in the plant area and the Multiunit 1/DFADA CCR units in the disposal area, approximately 1 mile west of the plant (**Figure 1-2**). The Weathered Lewis Shale and the hydraulically connected alluvial deposits along Chaco Wash are designated as the uppermost water-bearing unit in the disposal area. Although the Weathered Lewis Shale is geologically continuous in this area, it is unsaturated in the vicinity of the DFADA. The water table in the Weathered Lewis Shale can exhibit local seasonal fluctuations that are attributed to interactions between rates of groundwater recharge and discharge (Dames & Moore, 1988) from/to Morgan Lake (based on proximity), historical unlined ponds, and Chaco Wash. Groundwater flow underlying the disposal area CCR units generally follows the surface topography and descends to the west-southwest in the disposal area, mainly in the weathered shale and in local alluvial channels that drain toward the Chaco Wash (APS, 2013).

The third hydrostratigraphic unit (Unweathered Lewis Shale) consists of the Unweathered Lewis Shale geologic unit and is a regionally extensive confining unit that forms the base of the uppermost aquifers in the plant and disposal areas. The Unweathered Lewis Shale is not capable of yielding usable quantities of water and thus is not an aquifer.

1.2 CCR GROUNDWATER MONITORING SYSTEM

Multiple monitoring wells are in place at FCPP to monitor groundwater conditions beneath the five Site CCR units to meet the requirements of CCR rules. **Table 1-2** identifies each well with associated CCR unit information, the date of well installation, and summary well construction details. **Figure 1-2** presents a map of the well locations.

Installation of the FCPP CCR groundwater monitoring system is summarized in the *CCR Monitoring Well Network Report and Certification* (AECOM, 2017) and the *Groundwater Monitoring Network Certification Report for the Return Water Pond* (Wood, 2020a). Per the CCR Rule, Site monitoring systems are required to evaluate groundwater quality that is representative of background (i.e., groundwater that has not been affected by leakage from a CCR unit) and groundwater passing the downgradient boundary of each CCR unit, in the uppermost water-bearing hydrostratigraphic unit underlying the CCR unit.

In addition to the CCR groundwater monitoring system wells, there are many non-CCR supplementary monitoring wells and extraction wells at the Site that are not part of the CCR groundwater monitoring systems but may provide useful information to the program. Groundwater extraction at the Site predates implementation of the CCR Rule. Although some extraction wells have been installed as part of interim response measures (see Section 4.3), many older extraction wells are inactive in terms of extraction operations, but the well can be

monitored to assess groundwater conditions. **Table 1-2** and **Figure 1-2** identify the supplemental and extraction wells.

1.2.1 MONITORING SYSTEM DESCRIPTION

1.2.1.1 BACKGROUND GROUNDWATER MONITORING WELLS

Background water quality at the Site can be established by a single monitoring well or a group of monitoring wells. If a group of monitoring wells is used, these wells should be screened within the same lithologic unit and be supported by the CSM. The grouping and adequacy of background wells identified for FCPP to assess background water are adequate based on the current understanding of the geological and hydrostratigraphic conditions.

The processes used to evaluate and select the CCR unit background monitoring wells are documented in the *CCR Monitoring Well Network Report and Certification* (AECOM, 2017) and the *Groundwater Monitoring Network Certification Report for the Return Water Pond* (Wood, 2020a). The selected background monitoring wells and the rationales in selecting them are summarized below by hydrostratigraphic unit.

Background Wells for the Pictured Cliffs Sandstone. Three wells (MW-71, MW-72, and MW-73) are used to determine background groundwater quality for the URS, the CWTP, and the RWP in the Pictured Cliffs Sandstone (**Table 1-2** and **Figure 1-2**).

MW-71, MW-72, and MW-73 are considered representative of unimpacted groundwater even though they are not located upgradient of the RWP. Exploratory borings advanced during the design of the RWP CCR Monitoring System indicated that the Pictured Cliffs Sandstone upgradient of the RWP is unsaturated.

Background Wells for the Weathered Lewis Shale/Alluvium. Water in the Weathered Lewis Shale/Alluvium is perched and sourced by localized surface water infiltration. The hydrogeological regime, as well as the fractured nature of weathered shale, contributes to difficulties in reliably locating saturated sediments in the subsurface. On that basis, seven wells upgradient of Multiunit 1 and the DFADA, including MW-12R1, MW-43, MW-49A, MW-51, MW-50A, MW-55R, and MW-74, are designated to assess background groundwater quality for the Weathered Lewis Shale/Alluvium (**Table 1-2** and **Figure 1-2**). Background well, MW-12R1 has been dry for the last four years and no groundwater samples have been collected from this location in recent years. Many of these wells are routinely either dry or have a limited saturated thickness that precludes sampling; the wells are included in the program should conditions change in the future.

The FCPP SDAWP (WSP, 2023a) suggested that M-49A is susceptible to contamination and further evaluation and site investigations should be considered to determine if current background well designations are appropriate for the Multiunit. The adequacy of designated background monitoring wells is assessed on an ongoing basis.

1.2.1.2 DOWNGRADIENT CCR MONITORING WELL NETWORKS

A total of 27 CCR compliance wells are used to monitor groundwater conditions downgradient of each CCR unit (**Table 1-2** and **Figure 1-2**). Downgradient waste boundary wells assess for leakage from each CCR unit, and the remaining downgradient wells evaluate the nature and extent of groundwater conditions associated with identified releases from CCR units. Of the 27 downgradient or downgradient boundary wells, 16 are installed in the Pictured Cliffs Sandstone. The remaining 11 downgradient or downgradient boundary wells are completed in the Weathered Lewis Shale/Alluvium. The grouping of monitoring wells, spatial density, and coverage of the monitoring well network is adequate based on the current understanding of the geological and hydrostratigraphic conditions. These wells are identified by respective CCR unit, as described below:

URS Downgradient Wells (Pictured Cliffs Sandstone). Before the URS was demolished and replaced with the Upper Retention Tank (URT), the groundwater flow direction underlying the URS was radially outward from the CCR unit. On that basis, five downgradient boundary wells, MW-66, MW-67, MW-68, MW-69, MW-70, and four downgradient wells, MW-83, MW-84, MW-85, and MW-86, were installed around the perimeter and downgradient of the URS to evaluate leakage and the extent of groundwater impacts, respectively. The URS downgradient wells are screened within the Pictured Cliffs Sandstone hydrostratigraphic unit.

CWTP Downgradient Wells (Pictured Cliffs Sandstone). Similar to the URS, the groundwater flow direction underlying the CWTP was inferred to be radially outward from the CCR unit at the time the monitoring system was designed. Four downgradient boundary wells, MW-62, MW-63, MW-64, and MW-65 were installed around the perimeter of the CWTP. The *CCR Monitoring Well Network Report and Certification* (AECOM, 2017) identifies these wells as screened within the Pictured Cliffs Sandstone hydrostratigraphic unit. However, additional review of boring logs conducted as part of an Alternative Source Demonstration (ASD) in 2019 for the CWTP (Wood, 2020b) indicates that MW-62 and MW-63 are screened in non-native embankment fill materials, including Weathered Lewis Shale and bottom ash, that appear to influence the water quality of samples collected from these wells.

RWP Downgradient Wells (Pictured Cliffs Sandstone). Three downgradient boundary monitoring wells are installed within the Pictured Cliffs Sandstone hydrostratigraphic unit on the northeastern edge of the RWP – MW-88, MW-89, and MW-90. The Pictured Cliffs Sandstone is unsaturated beneath the RWP, and the wells are installed directly above the aquitard created by the underlying Unweathered Lewis Shale, which dips towards the northeast beneath the RWP. The groundwater monitoring system is designed to detect releases from the RWP, as a release would likely migrate vertically downward through the relatively permeable Pictured Cliffs Sandstone to the underlying Unweathered Lewis Shale, then migrate laterally along the surface of the aquitard. The next underlying aquifer (in the Cliff House Sandstone) is separated from the CCR unit by several hundred feet of the Unweathered Lewis Shale.

Multiunit 1 Downgradient Wells (Weathered Lewis Shale/Alluvium). Six downgradient boundary monitoring wells are in place along the toe of the western to southwestern edge of Multiunit 1 – MW-07, MW-08, MW-40R, MW-61, MW-75, and MW-76. In 2018, to characterize the nature and extent of impacts from the unit, downgradient monitoring well MW-87 was installed at the western lease boundary near the Chaco Wash. Monitoring data collected during both events are discussed further in Section 3.2. The screened interval for each Multiunit 1 downgradient well resides within the Weathered Lewis Shale/Alluvium hydrostratigraphic unit.

DFADA Downgradient Wells (Weathered Lewis Shale/Alluvium). Four downgradient boundary monitoring wells are identified downgradient of the DFADA: MW-10, MW-13, MW-44, and MW-48. Each well, except MW-48, is screened within the Weathered Lewis Shale/Alluvium hydrostratigraphic unit. The screened interval for MW-48 resides within the Unweathered Lewis Shale hydrostratigraphic unit. The groundwater monitoring system was designed to detect releases because the next underlying aquifer (in the Cliff House Sandstone) is separated from the CCR unit by several hundred ft of Lewis Shale. The downgradient DFADA wells are generally dry; however, insignificant amounts of condensate are known to sometimes accumulate in the wells. Excluding condensate, the wells were dry in 2024. Monitoring data collected during both events are discussed further in Section 3.2.

1.2.2 IMPLEMENTED CHANGES TO MONITORING SYSTEM

No changes to the current certified monitoring systems occurred during the 2024 reporting period.

2 SUMMARY OF KEY ACTIONS COMPLETED

A summary of key actions conducted at the Site during 2024 to address CCR Rule requirements is as follows:

- *Documentation of Groundwater Monitoring Activities Conducted in 2023* – 40 CFR §257.90(e) requires that an Annual Groundwater Monitoring and Corrective Action Report for applicable sites be prepared for existing CCR units annually on January 31 of the following year. During the reporting period, the *Annual Groundwater Monitoring and Corrective Action Report for 2023* (WSP, 2024) was prepared, placed in the facility’s operating record, and posted to the APS’s CCR information webpage in accordance with 40 CFR §257.105(h)(1) and 40 CFR §257.106(h)(1).
- *Continuation of the Detection Monitoring Program at the DFADA and RWP* – 40 CFR §257.94(b) requires the continuation of detection monitoring at a semi-annual frequency for Appendix III constituents at CCR units where statistical analysis of Appendix III constituent data do not indicate a statistically significant increase (SSI) over background. Section 3.2 presents the results of detection monitoring data collected on a semi-annual basis from the DFADA and RWP in 2024.
- *Continuation of the Assessment Monitoring Program at the CWTP* – 40 CFR §257.95 requires the continuation of assessment monitoring at a semi-annual frequency for Appendix IV constituents. Section 3.3 presents the results of assessment monitoring data collected on a semi-annual basis from the CWTP in 2024.
- *Statistical Analyses of Appendix IV Constituents at the CWTP* – 40 CFR §257.93(h) requires routine statistical analysis of Appendix IV constituent data from the CCR units in assessment monitoring. During the reporting period, two statistical analyses were performed using updated Appendix IV constituent data collected from CWTP monitoring wells. The statistical analyses are summarized in Section 3.3.
- *Statistical Analyses to Evaluate Background Threshold Values (BTVs)* - In accordance with the Statistical Data Analysis Work Plan (SDAWP; WSP, 2023a) background limits should be updated periodically to account for intrinsic temporal variations in groundwater conditions and maintain an adequate statistical power. The statistical analyses are summarized in Section 3.3.2 for the Multiunit and URS.
- *Preparation of a Semi-annual Progress Report on Remedy Selection for Multiunit 1 and the URS* – 40 CFR §257.97(a) requires the preparation of semi-annual reports, which document the progress of remedy selection for CCR units that have impacted groundwater. The ninth semi-annual report was prepared to fulfill that requirement in July 2024 of the reporting period (Section 4.5). Activities supporting remedy selection conducted during the second semi-annual reporting period of 2024 are summarized in Section 4.4.
- *Completion of a Fluoride Split-Sampling Laboratory Analysis* – A split method analysis was performed on data collected during the November 2023 monitoring event and the results were reported during the 2024 reporting period. The precision and accuracy of the split sampling data is presented in a Technical Memorandum including recommendations based on the results of the evaluation. The split method analysis is summarized in Section 3.1.1. and included as an appendix to this report.
- *Interim Response Measures at the URS* – Startup of groundwater extraction from CM-01 and CM-02 began in February 2022 and APS continued to operate the seepage extraction system throughout the reporting period. The extracted groundwater is discharged into a plant sump for reuse in plant operations. The 2024 URS extraction well operations are summarized in Section 4.3
- *Interim Response Measures at the Multiunit 1* – APS operated the Northern Intercept Trench (NIT) and Southern Intercept Trench (SIT) throughout the reporting period to intercept and collect seepage from Multiunit 1 and closed surface impoundments. The extracted groundwater is reused in plant operations. The 2024 NIT and SIT operations are summarized in Section 4.3.
- *Continuation of the CWTP Dredging Program* – APS completed removal of CCR from the CWTP through mechanical excavation and hydraulic dredging. Documentation of the removal will be completed in 2025.
- *Well Construction at URS*. APS installed four wells north of the URT, including two supplementary monitoring wells (URS-05 and URS-08) and two inactive extraction wells (URS-06 and URS-07). The installation began in

December 2023 and development was completed in January 2024. A technical report documenting that work, dated March 27, 2024, with an addendum dated April 4, 2024 is included in **Appendix A**.

- *Chaco Wash Flow Measurement Station* - The Chaco Wash flow measurement station was evaluated and maintenance performed in June 2024. The maintenance report is included in **Appendix B**.

3 GROUNDWATER MONITORING PROGRAM

The groundwater monitoring and corrective action process defined in the CCR Rule includes a phased approach to groundwater monitoring, leading (if applicable) to the establishment of groundwater protection standards (GWPSs) for each CCR unit. Exceedances of the GWPSs that are determined to be statistically significant can trigger requirements for additional groundwater characterization and corrective measures assessment followed by implementation of a corrective action program.

The first phase of groundwater monitoring is the detection monitoring phase. Detection monitoring focuses on a set of CCR constituents (listed in Appendix III of the CCR Rule) that are more mobile and generally present at higher concentrations. These attributes can contribute to making constituents readily quantified and early indicators of a potential release from a CCR unit to groundwater. If SSIs are detected for Appendix III constituent over established background levels, otherwise known as background threshold values (BTVs), in downgradient waste boundary wells and cannot be demonstrated to be associated with a source other than the CCR unit, the groundwater monitoring moves into the second phase, assessment monitoring. **Table 3-1** and **3-2** summarizes the BTVs for Site CCR units.

The second phase of groundwater monitoring focuses on the constituents listed in Appendix IV of the CCR Rule. The Appendix IV constituents are generally less mobile and typically occur at lower concentrations in groundwater than the Appendix III constituents. Concentrations of Appendix IV constituents in downgradient wells are compared to established GWPSs. The GWPSs, established for Appendix IV constituents only, are the higher of either the federal Safe Drinking Water Act Maximum Contaminant Level, alternative human health risk-based GWPSs established in the CCR Rule, or the BTV calculated for each constituent. **Table 3-1** summarizes the GWPSs for Site CCR units.

3.1 PROGRAM STATUS

Based on available Appendix III and Appendix IV concentrations and statistical analyses completed as of the end of the 2024 reporting period, the DFADA and RWP are currently in detection groundwater monitoring and the CWTP is currently in assessment groundwater monitoring. During the 2024 reporting period, all DFADA and RWP downgradient compliance wells continued to be dry and, therefore, precluded groundwater sampling and groundwater quality evaluation. The URS and Multiunit 1 (the LAI/LDWP) are in corrective action and continue to be monitored as part of the assessment groundwater monitoring program.

Summaries of groundwater monitoring program activities performed during the reporting period are presented in the following sections.

3.1.1 PROBLEMS ENCOUNTERED AND RESOLUTIONS TO PROBLEMS

The following problems and associated resolutions were encountered during the reporting period:

- During the first semi-annual 2024 event, Eurofins TestAmerica Laboratories (Eurofins) demonstrated issues with inconsistent sample dilution factors (DFs) and reporting limits (RLs), similar to those experienced in recent years (Wood 2021, 2022, WSP 2023, 2024). Following the first semi-annual 2023 monitoring event, during which fluoride analyses exceeded BTVs, WSP and APS met extensively with Eurofins to seek a resolution. This resolution included updating the project notes with the maximum allowable DFs and RLs and conducting an evaluation during the second semi-annual 2024 event of an alternative analytical method recommended by Eurofins, United States Environmental Protection Agency (USEPA) Method 9056A.

The second semi-annual 2023 monitoring event evaluation, conducted by WSP, included a split-sample analysis to compare the performance of the groundwater monitoring program's fluoride method, USEPA Method 300.0, to the alternative method, USEPA Method 9056A. The evaluation, completed in 2024 and detailed in **Appendix C**, concluded that the recent DF and RL issues were not caused by the selected analytical method but by over-dilution of the samples by the Eurofins analyst. WSP recommended continuing the use of USEPA Method 300.0 and considering a change in the contracted laboratory if Eurofins continued to demonstrate performance errors.

In the first semi-annual 2024 monitoring event, fluoride was reported at a concentration of 8.7 milligrams per liter (mg/L) at MW-83, exceeding the project specific criteria of 4.0 mg/L. This intermediate detection raises concerns about its reliability, as it is inconsistent with historical data at this location and the result in second semi-annual 2024 monitoring event (1.58 mg/L). The data was deemed useable based on the Stage 2A validation but appears to be anomalous which was confirmed by the second semi-annual 2024 monitoring event. The fluoride results at MW-83, along with the recurrence of DF and RL issues during the first semi-annual 2024 monitoring event coupled with significant delays in laboratory report delivery, prompted APS to transition to an alternative laboratory. As of the second semi-annual 2024 monitoring event, Pace Analytical Laboratories (Pace) will perform the required analysis for CCR groundwater monitoring.

3.1.2 GROUNDWATER MONITORING PROGRAM TRANSITIONS

No CCR unit monitoring program transitions occurred during the reporting period.

3.1.3 ALTERNATIVE SOURCE DEMONSTRATIONS

No ASDs were conducted during the 2024 reporting period.

3.2 MONITORING DATA COLLECTED

CCR groundwater monitoring was conducted at FCPP during the 2024 reporting period in accordance with the updated *Site Sampling and Analysis Plan* (SAP) (Wood, 2022a). The SAP documents the methods and procedures used to conduct groundwater sampling, analyze collected samples for CCR constituents, and assess associated analytical data for quality assurance purposes.

The first semi-annual groundwater monitoring event took place in May 14 through 23, 2024 (SA1 2024) and the second semi-annual monitoring event took place in October 17 through November 16, 2024 and December 12, 2024 (SA2 2024). The following sections summarize groundwater monitoring activities conducted in 2024. **Table 3-2** identifies when monitoring occurred, and which units were monitored. Unless otherwise noted, detection monitoring included evaluation of samples for Appendix III constituents on a semi-annual basis (40 CFR §257.94[b]) and at a minimum, assessment monitoring included evaluation of samples for all Appendix IV constituents on an annual basis (40 CFR §257.95[b]) and detected Appendix IV constituents, as well as all Appendix III constituents on a semi-annual basis (40 CFR §257.95[d][1]). To simplify groundwater monitoring logistics, CCR compliance wells in assessment monitoring were evaluated for all Appendix IV constituents on a semi-annual basis in 2024.

The DFADA wells are completed in either the Weathered Lewis Shale/Alluvium or Unweathered Lewis Shale while the RWP wells are completed in the Pictured Cliffs Sandstone. These hydrostratigraphic units are known to be dry downgradient of the DFADA and the RWP. Thus, the DFADA and RWP groundwater monitoring systems are designed to detect releases by the presence of water (although insignificant amounts of condensate can accumulate in wells). During the SA1 and SA2 2024 monitoring events, these wells were found to be dry, which is consistent with previous readings and indicates that releases from the DFADA and RWP did not occur in 2024.

Supplementary and extraction well water samples were also collected as part of characterization, pre-design and corrective measures evaluations conducted during the reporting period, which include:

- Seepage intercept system (i.e., interim response measures) samples collected from sumps.
- Groundwater samples collected downgradient of seepage intercept systems.
- Surface water samples from the CWTP, Morgan Lake, and the cooling water canal adjacent to the CWTP.

As with the CCR groundwater samples, the supplementary samples were collected and analyzed using industry-standard procedures and in accordance with the SAP.

3.2.1 WATER LEVEL MONITORING

Figure 3-1 presents a potentiometric surface contour map created using water-level measurements collected from May 14 through 18, 2024 (SA1 2024). **Figure 3-2** presents a potentiometric surface map created using water-level measurements collected from October 17 through November 14, 2024 (SA2 2024). **Appendix D** presents hydrographs depicting groundwater elevations measured at downgradient CCR monitoring system wells over time. Groundwater elevations in the Pictured Cliffs Sandstone (i.e., plant area) and the Weathered Lewis Shale/Alluvium (i.e., disposal area) are graphed independently based on assessment of the data during initial CSM development; review of the data suggests that the two groundwater systems are likely not in direct communication. Unless otherwise noted below or within the hydrographs of **Appendix D**, hydrographs are based on water level measurements collected semi-annually during the groundwater monitoring events; therefore, the significant trends discussed below may be somewhat limited.

Downgradient and downgradient boundary wells for Multiunit 1 (MW-07, MW-08, MW-40R, MW-61, MW-75, MW-76, and MW-87): Trends indicated slowly declining groundwater elevations at MW-61, MW-75, and MW-76. All other wells (MW-07, MW-40R, MW-87 and MW-08) downgradient of the Multiunit 1 indicate minor trend fluctuations with an overall stable groundwater level. The minor trend fluctuations observed at MW-08 and MW-87 are likely attributable to seasonal fluctuations in the groundwater table and interactions with stream flow within the Chaco Wash (at MW-87). The increasing water level trend noted in 2023 in MW-07 has reversed and the trend in this well in 2024 was decreasing, indicating that the slight rise noted in 2023 was part of the long-term trend of minor fluctuations in the well. Groundwater flow in the Weathered Lewis Shale is dominated by preferential flow paths due to the fractured flow regime and therefore it would not be unusual for fluctuation trends to vary in small areas (AECOM 2017).

MW-40R and MW-76 did not contain enough groundwater within the well casing to support the collection of groundwater samples during both the SA1 and SA2 2024 semi-annual sampling events. Due to minimal groundwater and/or poor recovery rates, groundwater samples have not been collected from these wells since April 2021 per the SAP (Wood, 2022a).

Background wells for Multiunit 1 (MW-43, MW-49A, MW-50A, MW-51, and MW-74): Water levels in background wells MW-43, MW-49A, MW-50A, and MW-51 remained stable. Seasonal variations in groundwater elevations continue to be apparent at MW-74 (background well for Multiunit 1, and located downstream of Morgan Lake Dam), with the higher elevations occurring in early spring and the lower elevation occurring in late summer to late fall. Water level fluctuations at MW-74 (located just south of 'No Name Wash') may be influenced by discharges from Morgan Lake into 'No Name Wash'. The water level in Morgan Lake is managed by FCPP as part of its operation. Typical seasonal patterns appear to have continued during the 2024 reporting period.

MW-51 and MW-74 contained insufficient amounts of groundwater within their respective well casing during the SA1 and SA2 2024 semi-annual sampling events. As a result, groundwater samples were not collected from these locations in 2024 in accordance with the SAP (Wood, 2022a). These wells have not been sampled since April 2021 due to minimal groundwater and/or poor recovery rates. In contrast, MW-43 and MW-50A were affected by low water levels during SA2 2024 but were able to be sampled using modified methods, as discussed in Section 3.2.3.

Downgradient and downgradient boundary wells for URS (MW-66, MW-67, MW-68, MW-69, MW-70, MW-83, MW-84, MW-85, and MW-86): In contrast to the steadily declining trend observed since July 2016, groundwater elevations downgradient of the URS generally increased between November 2023 and May 2024, before declining in October 2024. MW-66 shows a large drop in water level (1.71 ft) from November 2023 to May 2024 before returning to the trend in October 2024, indicating that the May 2024 water level is anomalous. The minor fluctuations observed in 2024 are likely attributable to operation of the extraction wells at the URS, dredging activities in the CWTP, and operation of Morgan Lake. The overall decline in water levels since 2016 is

attributed to the decommissioning of the URS between June and December 2018 and pumping at the URS extraction wells CM-01 and CM-02 beginning in February 2022.

Downgradient boundary wells for the CWTP (MW-62, MW-63, MW-64, and MW-65): Groundwater elevations at MW-62, MW-63, MW-64 and MW-65 generally show a declining trend beginning in November 2020 which coincides with discharges to the unit ceasing in November 2020 and water levels in the surface impoundment have been maintained at lower elevations since that time to prevent discharges from the unit to the adjacent canal during dredging (Section 4.5.2). Groundwater elevations declined at all wells however the elevations each year show an increase in the spring followed by a decreased level in the fall attributed to seasonal variations.

Background wells for URS and CWTP (MW-71, MW-72, and MW-73): Groundwater elevations at MW-71 and MW-72 generally continued to decrease during 2024, with minor trend fluctuations attributed to seasonal variations. Groundwater elevation at MW-73 increased in 2024. MW-73 is located near Morgan Lake and is likely influenced by fluctuations of the water elevation at the lake.

Figures 3-1 and 3-2 present potentiometric surface maps that are representative of groundwater elevations prior to groundwater sampling for SA1 and SA2 in 2024, respectively. The estimated direction and gradient of groundwater flow derived from collected groundwater elevation data are noted in the figures.

3.2.2 GROUNDWATER FLOW ESTIMATION

The CCR Rule requires that groundwater flow rates beneath CCR units be estimated during each monitoring event. To meet the requirement, water levels measured at the time of sampling events were used to calculate the direction and magnitude of the hydraulic gradient in the vicinity of each unit using a spreadsheet tool available on the USEPA website (USEPA, 2014). Darcy's Equation for flow through porous media was then used with Site data (where available) and/or literature-based hydraulic conductivity and effective porosity values for hydrogeologic units to estimate groundwater flow rates. Groundwater flow rates and gradient magnitudes were calculated separately for the Pictured Cliffs Sandstone underlying the URS and CWTP, respectively, in 2024, to evaluate the influence pumping at the URS extraction well system had at the units. **Table 3-3** summarizes the results of these calculations.

The data collected during the reporting period suggest that the water table in the plant area is relatively flat (as compared to other areas) and in hydraulic communication with Morgan Lake. The hydraulic gradients and groundwater flows observed in the Pictured Cliffs Sandstone at the former URS and CWTP during the 2024 reporting period are discussed below:

- **For the Pictured Cliffs Sandstone underlying the former URS**, the magnitude of the hydraulic gradient was 0.0003 and 0.0007 ft per ft (ft/ft), for measurements taken in SA1 and SA2 2024, respectively. The direction of groundwater flow (collectively for all wells) was north-northwest towards Morgan Lake for both sampling events. The directions calculated were 346 and 348 degrees from north for measurements collected in SA1 and SA2 2024, respectively. Corresponding groundwater flow rates were 0.01 and 0.02 ft per day (ft/d) for measurements collected during SA1 and SA2 2024, respectively. The URS extraction well pump operation appears to still have an impact on the groundwater flow direction in the area of the URS, which remains directed in a northerly direction with some localized flow towards the extraction well system.
- **For the Pictured Cliffs Sandstone underlying the CWTP**, the magnitude of the hydraulic gradient was 0.0006 and 0.0007 ft/ft for measurements taken in SA1 and SA2 2024, respectively. The direction of groundwater flow at the CWTP was changed between SA1 and SA2 2024 from the southwest (199 degrees) to the southeast (122 degrees). Corresponding groundwater flow rates were 0.01 and 0.02 ft/d for measurements collected in SA1 and SA2 2024, respectively. Because the CWTP is being dredged, the water level in this unit is maintained by pumping water from the cooling water canal into the unit. The changes in groundwater flow directions observed in downgradient CWTP wells may be impacted by lower Morgan Lake levels and the dredging activity conducted in the CWTP during the reporting period.

The hydraulic gradients and flow directions in the Lewis Shale underlying Multiunit 1 at the disposal area were relatively stable. The magnitude of the hydraulic gradient was 0.03 (ft/ft) during each monitoring round and the direction of groundwater flow was southwest towards Chaco Wash (257 and 256 degrees from north for SA1 and

SA2 2024 measurements, respectively), which is comparable to historical gradient and direction values. The corresponding groundwater flow rate for SA1 and SA2 2024 was 0.0002 (ft/d), which is also comparable to historical flow rates.

3.2.3 SAMPLE COLLECTION

During the 2024 reporting period, groundwater samples were collected from CCR monitoring wells during SA1 and SA2 2024. Groundwater samples were collected, labeled, preserved, and shipped in accordance with the SAP (Wood, 2022a). In some instances, the wells were observed to be dry upon monitoring or did not have enough water and could not be sampled (**Table 3-2**). As noted in Section 3.2.1, MW-43 and MW-50A contained insufficient groundwater during SA2 2024 for traditional sampling methods. However, both wells contained enough water to allow for a modified sampling method, which involved purging the well and then allowing time for the well to recharge before sampling with a low flow sampling pump. These locations were bailed to remove water on October 17, 2024 and sampled on November 15, 2024. MW-43 yielded sufficient water to collect samples for all Appendix III and IV constituents, whereas MW-50A, with a recharge of only 0.64 ft, yielded only enough sample volume for the analysis of total recoverable cobalt and molybdenum.

In accordance with 40 CFR §257.93(i), which requires the measurement of total recoverable metals, collected groundwater samples were not field filtered prior to analysis. Pursuant to the SAP, quality control samples (i.e., field duplicates, field blanks, and extra sample volume for matrix spike samples) were collected during each groundwater monitoring event. These samples are noted on associated chain-of-custody documentation.

3.2.4 SAMPLE ANALYSIS AND DATA VALIDATION

Groundwater samples collected during the SA1 2024 sampling event were submitted to Eurofins and Radiation Safety Engineering, Inc. (Radiation Safety) located in Phoenix, Arizona, for required analysis. Eurofins evaluated samples for all constituents excluding radium. Radiation Safety performed the radium analyses. Both Eurofins and Radiation Safety are Arizona Department of Health Services-licensed laboratories (AZ0728 and AZ0462, respectively). Groundwater samples collected during the SA2 2024 sampling event were submitted to Pace and Radiation Safety located in Phoenix, Arizona, for required analysis. Pace evaluated samples for all constituents excluding radium. Radiation Safety performed the radium analyses. Pace is an Arizona Department of Health Services-licensed laboratory (AZ0612). **Appendix E** presents the associated laboratory reports of analysis organized by CCR unit.

Table 3-1 and **3-2** identifies the analytes evaluated during each monitoring event. Analytes varied based on the monitoring program (i.e., detection versus assessment monitoring) or field investigation. The SAP identifies Appendix III and Appendix IV constituents with associated analytical methods.

Following receipt of final laboratory reports of analysis, the reports and associated sample data collected during detection and assessment monitoring were evaluated for quality assurance purposes. The scope of the review was an USEPA Stage 2A validation (USEPA, 2009). **Appendix F** presents the *2024 Data Validation Report* which documents the reviews. No data was deemed unusable in 2024. The following are key observations related to data usability:

- Some samples were diluted to the point that the RL was not able to meet the GWPS (antimony, beryllium, cobalt, and molybdenum in the SA1 2024 event and fluoride in the SA2 2024 event). To demonstrate compliance with the applicable regulatory limits, those sample results were estimated at a concentration between the method detection limits (MDLs) and the RL (flagged with a 'J' data qualifier). RLs are preferred over MDLs for establishing a sample's detection status (i.e., detect or non-detect) in statistical evaluations because RLs represent the concentration at which an analyte can be reliably quantified with confidence.

Modifications to the laboratory detection limits (RL and MDL) are not uncommon but will require evaluation on a case-by-case basis during statistical analysis. If the MDL must consistently be used as the limit of detection in Appendix III or Appendix IV statistical analyses to maintain compliance with applicable standards, it may indicate that the BTV is not achievable with the laboratory's current analytical capabilities and based on site samples. In such cases, a re-evaluation of the BTV may be warranted.

- In some instances, the SA2 2024 final laboratory reports were issued with analyses unnecessarily reported to the MDL, even when the RL was able to achieve the required detection limit. To ensure timely submittal of this report, results were modified by the WSP chemist, where appropriate, using the RL as the detection limit. The modified results are captured in the data validation report and tabulated data (**Appendix F**).

Data qualifiers and reason codes are included in the *2024 Data Validation Report* in **Appendix F**.

3.2.5 SAMPLE RESULTS

Appendix G presents the groundwater sampling results for 2024 along with historical groundwater quality data for the Site. The groundwater quality data collected during the reporting period are discussed further in Section 4.2.

3.3 STATISTICAL ANALYSIS OF MONITORING DATA

Statistical analysis of Appendix III and Appendix IV constituent data was conducted during the reporting period as required by the CCR Rule to evaluate whether collected monitoring data indicate Site CCR units have adversely impacted underlying groundwater. The analyses were conducted in accordance with the SDAWP (WSP, 2023a).

3.3.1 BTV UPDATES

Routine updates of the BTVs at the URS and Multiunit 1 were performed during the 2024 reporting period in accordance with the SDAWP (WSP, 2023a) to ensure BTVs represent current background conditions.

A statistical evaluation to update the BTVs for the URS for the Appendix IV constituents was completed in January 2025 and is included in **Appendix H**. The BTV update utilizes constituent data through November 2023 from background wells, MW-71, MW-72, and MW-73. The updated BTVs were used to evaluate and update the applicable GWPS, as necessary. The URS is currently in corrective action and the statistical evaluation was performed in accordance with the SDAWP (WSP, 2023a). The GWPS selection changed for antimony, cobalt, fluoride, lithium, and selenium and the BTVs were updated for all constituents excluding barium, mercury, and molybdenum (**Appendix H**). Updated BTVs were used for comparison of SA2 2024 data and are presented in **Table 3-2**. The updates include BTV increases for fluoride, beryllium, lithium and selenium and decreases for antimony, chromium, cobalt, lead, thallium, combined radium, and cadmium (**Table 3-2**). The GWPS selection for antimony and combined radium was changed to the USEPA maximum contaminant level. The GWPS selection for fluoride was updated to the BTV.

A statistical evaluation to update the BTVs calculated for the Multiunit 1 for each Appendix IV constituent was completed in January 2025 and is included in **Appendix I**. A statistical evaluation was performed for the Multiunit 1 to update the BTVs incorporating Appendix IV constituent data through May 2024 from background wells, MW-12R1, MW-43, MW-49A, MW-51, MW-50A, MW-55R, and MW-74. The analysis was only performed using only background wells, MW-49A and MW-74, as the remaining background wells have historically been dry or yielded low water volumes, limiting sample collection. The updated BTVs were used to evaluate and update the applicable GWPS, as necessary. The Multiunit 1 is currently in corrective action and the statistical evaluation was performed in accordance with the SDAWP (WSP, 2023a). The statistical evaluation of the BTVs associated with the Multiunit 1 is included in **Appendix I**. The updated BTVs were used as the GWPS for lithium and selenium. For lithium, the BTV decreased and the selenium BTV increased. Based on the BTV updates, the GWPS selection for antimony, fluoride, and thallium was updated to the USEPA maximum contaminant level. The GWPS selection for cobalt and molybdenum was updated to the alternative risk-based GWPS. All updated BTVs were used for comparison of SA2 2024 data and are presented in **Table 3-2**.

3.3.2 EVALUATION OF APPENDIX III CONSTITUENT DATA

Two CCR units remained in detection monitoring as of the end of 2024, the DFADA and the RWP. There were no groundwater samples collected from the DFADA or the RWP CCR compliance wells during the reporting period due to insufficient groundwater availability in the respective monitoring wells, and thus no statistical analyses were performed using data collected from these units.

3.3.3 EVALUATION OF APPENDIX IV CONSTITUENT DATA

Statistical analysis of assessment monitoring data occurred for one CCR unit, the CWTP, during 2024. Assessment monitoring rounds corresponding to these analyses were conducted in November 2023 and May 2024 (per 40 CFR §257.95[d][1]) at the CWTP. A statistical analysis of assessment monitoring data collected at the CWTP through November 2023 was completed in April 2024 and is presented in **Appendix J**. The statistical analysis indicated no Appendix IV constituents were detected at concentrations exceeding their respective GWPSs during the November 2023 groundwater sampling event. A statistical analysis of assessment monitoring data collected at the CWTP through May 2024 was completed in November 2024 and is presented in **Appendix K**. The statistical evaluation declared that there are no SSLs of Appendix IV constituents above their respective GWPSs at the CWTP during the May 2024 groundwater sampling event.

Review of Appendix IV monitoring results at the URS and Multiunit 1 indicates data collected in 2024 are consistent with historical findings. No new exceedances of constituents not otherwise in corrective action above the GWPSs are reported during 2024. As such, no changes to the assessment of corrective measures and remedy selection are warranted at this time.

4 CORRECTIVE ACTION PROGRAM

A corrective action program is required under 40 CFR §257.96 when one or more Appendix IV constituents are present at SSLs above GWPSs or immediately upon detection of a release from a CCR unit. The program begins with an assessment of corrective measures to evaluate potential remedies for preventing further release, mitigating impacts, and restoring groundwater quality. Following this assessment, a remedy is selected and implemented, with interim measures taken if necessary. Assessment groundwater monitoring continues throughout corrective action.

4.1 PROGRAM STATUS

Based on the declaration that one or more Appendix IV constituents are present at SSLs above GWPSs downgradient of Multiunit 1 and the URS, these units are currently in the corrective action program. Notification of the exceedances occurred on November 14, 2018, and were documented in the 2018 Annual Groundwater Monitoring and Corrective Action Report (Wood, 2019a).

A summary of corrective action program activities conducted during the reporting period is presented in the following sections.

4.2 CHARACTERIZATION OF POTENTIAL RELEASES FROM CCR UNITS

To characterize releases from CCR units, 40 CFR §257.95(g)(1) requires: (i) the installation of wells to define the extent of contaminant plumes, (ii) collection of data on the nature and estimated quantity of material released, (iii) installation of at least one well at the facility boundary in the direction of contaminant migration, and (iv) sampling of these wells to characterize the nature and extent of the release.

Initial efforts to address the requirements of 40 CFR §257.95(g)(1) were documented in the *Hydrogeologic Investigation of Multiunit 1 and the Upper Retention Sump* (Wood, 2020c). However, due to the duration required to adequately characterize complex groundwater impacts, work supporting characterization of potential releases from CCR units is ongoing.

During the reporting period, activities conducted to address CCR Rule release characterization requirements downgradient of Multiunit 1 and the URS included:

- The collection of groundwater quality data from an expanded network of existing groundwater wells (Section 3.2);
- Delineation of the nature and extent of the release from Multiunit 1 and the URS in the form of plume maps (**Figures 4-1 through 4-6**). **Figures 4-1, 4-3, and 4-5** delineate the data collected in SA1 2024 and **Figures 4-2, 4-4, 4-6** delineate the data collected in SA2 2024.

Findings from these characterization activities are summarized as follows and further discussed in Section 4.4.

Multiunit 1: Molybdenum and cobalt are present at concentrations above their respective GWPSs in groundwater downgradient of Multiunit 1, including a region upgradient of MW-60, which is a past CCR conveyance corridor to former ash ponds. The use of this region for CCR management prior to the construction of Multiunit 1 makes it difficult to distinguish whether impacts are associated with the LAI or previous Site activities.

Assuming the LAI contributed to impacts upgradient of MW-60, the extent of molybdenum impacts associated with Multiunit 1 appear to be limited generally to the area directly downgradient of the LDWP and downgradient of the LAI along the northern edge of the LDWP (**Figures 4-1 and 4-2**).

The extent of cobalt concentrations that exceed the GWPS generally extend from Multiunit 1 to the SIT (**Figures 4-3 and 4-4**). During the reporting period, cobalt exceeded the GWPS (0.01 mg/L in SA1 2024, 0.006 mg/L in SA2 2024) at the following wells located upgradient of the SIT: MW-11, MW-16, MW-17R, MW-36R, MW-38R, MW-52, MW-60, MW-61, and MW-75. The maximum cobalt concentration observed during the reporting period was 0.21 mg/L at MW-36R.

Offsite migration of cobalt downgradient of the Multiunit 1 is controlled by the operation of the SIT and NIT. Cobalt and other Appendix IV constituents were detected at concentrations marginally exceeding the GWPS at multiple wells located downgradient of the SIT in SA1 and SA2 2024. Cobalt was detected in downgradient CCR well MW-87 and supplementary wells MW-18, DMX-04 (SA1 2024 only), and MW-57 (SA2 2024 only). Historically, intermittent exceedances of cobalt at levels slightly above the GWSP have been observed at wells downgradient of the SIT, including MW-18, DMX-03, DMX-04, MW-57, MW-56, and MW-87. An evaluation of groundwater conditions downgradient of the SIT, summarized in a technical memorandum dated January 20, 2023 (WSP, 2023b), concluded that past exceedances were likely attributable to a variety of potential causes. Past cobalt exceedances at wells MW-18 and MW-87 were attributed to one or more of the following factors: naturally occurring inorganic compounds present as fines in the aquifer due to inadequate well development or disuse; evapoconcentration of metals caused by dewatering of the aquifer during trench operations; and contributions of cobalt and molybdenum from Chaco Wash. Based on stream monitoring and nearby groundwater level data, Chaco Wash appears to be a losing reach along the Site boundary, particularly near MW-87. The operation of the trenches continues to effectively prevent the migration of CCR constituents downgradient of the trenches.

URS: Fluoride is present at concentrations above the GWPS (4 mg/L in SA1 2024, 4.2 mg/L in SA2 2024) in groundwater in the vicinity of the URS. During the reporting period, the maximum concentration of fluoride observed was 14.0 mg/L and 18.2 mg/L at MW-66, located north of the former footprint of the URS. Fluoride also exceeded the GWPS at downgradient boundary wells MW-67 (8.27 mg/L [SA2 2024 only]), MW-68 (12.5 mg/L [SA2 2024 only]), and MW-69 (9.40 mg/L [SA1 2024 only]). Concentrations have declined in these wells since initial characterization of impacts and the demolition of the URS (the highest historical fluoride concentration observed downgradient of the URS was 32.0 mg/L).

Fluoride concentrations in CM-01 and CM-02 were below the GWPS for both sampling events in 2024 as further evidence of overall reduction in concentrations around the URS. The extraction and supplementary wells installed downgradient of the URS in 2023 have fluoride concentrations exceeding the fluoride GWPS at URS-05, URS-07, and URS-08 with the highest concentration of 8.69 mg/L in URS-05 (**Figures 4-5 and 4-6**).

DFADA: Although there was not enough water present in downgradient boundary DFADA wells to sample (Section 3.2), groundwater samples were collected during the reporting period from MW-11 and MW-16, which are both supplementary wells located more than 2,000 ft downgradient of the DFADA near surface drainage channels and upgradient of the SIT. As supplementary wells, MW-11 and MW-16 are not part of the certified CCR monitoring system for either the DFADA or Multiunit 1. Because MW-11 and MW-16 are completed in the Weathered Lewis Shale, the BTVs and GWPSs identified for Multiunit 1 (which are based on data collected from MW-49A and MW-74) in **Table 3-1** are the most applicable.

Cobalt concentrations at MW-11 in SA1 and SA2 2024 were 0.019 and 0.021 mg/L, respectively, which exceed the Multiunit 1 GWPS of 0.010 mg/L effective in SA1 2024 and 0.006 mg/L in SA2 2024. Cobalt concentrations at MW-11 have exceeded the Multiunit 1 GWPS since November 2021 when monitoring of the well for CCR constituents began. At MW-16, which is located approximately 650 ft downgradient of MW-11, cobalt was measured exceeding the GWPS for the first time in SA2 2024 at a concentration of 0.0091 mg/L in SA2 2024. While the concentration observed at MW-16 represents a new maximum, the concentration observed in SA2 is within the same order of magnitude as previous detections and would not have led to a GWPS exceedance prior to the GWPS update in SA2. Molybdenum concentrations in samples collected from MW-11 and MW-16 during the 2024 sampling events were less than reporting levels.

The cobalt exceedances observed at MW-11 cannot be correlated with any identifiable factor at this time. Boron, typically an indicator of CCR-impacted groundwater, has been detected at low concentrations at MW-11 and has remained relatively stable since CCR constituent monitoring began at this well, ranging from 0.50 to 0.54 mg/L (**Appendix G**). There has been more variability in sulfate concentrations at MW-11, which could be associated with surface water interactions with the Weathered Lewis Shale. Sulfate concentrations at MW-11 in SA1 and SA2

2024 were 3,000 and 60,000 mg/L, respectively, but the maximum sulfate concentration observed at the well was 140,000 mg/L in November 2021 (**Appendix G**).

At this time, elevated cobalt concentrations at MW-11 and MW-16 do not appear to be associated with a release from the DFADA and the certified downgradient boundary wells are located and installed appropriately to monitor for leakage from the DFADA. APS will continue to monitor the presence of cobalt in monitoring wells MW-11 and MW-16 during subsequent monitoring events.

4.3 INTERIM RESPONSE MEASURES

While remedy selection progressed during the reporting period (Section 4.4), APS implemented several interim response measures at Multiunit 1 and the URS to limit impacts to groundwater. The interim response measures will also help to evaluate the effectiveness of potential remedial technologies. The interim response measures implemented during the reporting period and planned for continued implementation in 2025 are summarized below.

Operation of the Northern Intercept Trench and Southern Intercept Trench. APS currently operates a 7,600-ft-long seepage intercept trench system that was installed in two interconnected sections (the NIT and SIT) along the western boundary of the Site lease boundary. The purpose of the intercept trench system is to intercept and collect seepage from the closed and existing CCR units as it flows westward towards Chaco Wash, thus preventing any potential groundwater contamination from impacting the wash (Wood, 2019a). The NIT was constructed and placed into service in 2011, and the SIT was constructed and placed into service in 2013. The trench system replaced an extraction well system that was assessed as ineffective. The extraction well system has not been fully decommissioned but does not contribute appreciable amounts of extracted groundwater to seepage collection system operations. In 2021, two new extraction wells were added to seepage collection system operations upgradient of the NIT (MW-82S and EW-17); only EW-17 remained operable in 2024.

In 2024, 2,365,053 gallons were pumped from the NIT with a daily average of 6,427 gallons per day (gpd) and 11,194,238 gallons were pumped from the SIT for a daily average of 30,419 gpd.

The estimated contaminant of concern (COC) mass removed from the groundwater by these systems in 2024 is based on the totalized annual flow extracted in intercept trench operations and average constituent concentrations measured at each associated sump. There is currently flow metering equipment available to estimate flow rates at the NIT seepage collection systems (i.e., Sump-7, Sump-8, and EW-17) and at the SIT seepage collection systems (i.e., Sump-9, Sump-10, Sump-11, Sump-12, Sump-13, Sump-14-1, Sump-15-1, Sump-16-1, Sump-17, and Sump-18). **Tables 4-1** and **4-2** display the results of the calculation. The total estimated mass removed at the NIT was 0.64 pounds (lbs) and at the SIT was 7.29 lbs for a total removal of 7.93 lbs of cobalt and molybdenum in 2024.

Operation of Extraction Wells at the URS. The URS extraction well system became operational in February 2022, following the installation of pumps, piping, and an electrical control system at URS extraction wells CM-01 and CM-02.

Approximately 743,931 gallons were pumped from the URS extraction wells in 2024 for a daily average of 2,022 gpd. The estimated COC mass removed from the groundwater by these systems is based on the totalized annual extracted flow and the constituent concentration measured at each extraction well during the SA1 and SA2 2024. The results of the mass removed calculation are included in **Table 4-3**. The total estimated mass of fluoride removed from wells in the vicinity of the former URS was 9.39 lbs in 2024.

4.4 PROGRESS ON REMEDY SELECTION FOR MULTIUNIT 1 AND THE URS

In response to GWPS exceedances at Multiunit 1 and the URS and pursuant to 40 CFR §257.96(a), an Assessment of Corrective Measures (ACM) was prepared in 2019 (Wood, 2019b) to evaluate the performance of several combined

corrective measures to address groundwater impacts resulting from Multiunit 1 and the URS. Since completing the ACM, various evaluations and pre-design studies necessary to support the selection and design of remedies for Multiunit 1 and the URS have been conducted (Wood, 2020b; Wood, 2021). Updates on the status of these studies and progress on remedy selection are presented below.

4.4.1 CORRECTIVE MEASURES PRE-DESIGN STUDIES

Evaluations and pre-design studies completed during the 2024 reporting period are described below.

Continued Additional Monitoring at Multiunit 1. An expanded list of supplementary wells and constituents across the Site were monitored during the reporting period. The water quality data from these wells helps to refine the delineation of elevated concentrations of cobalt and molybdenum in groundwater downgradient of Multiunit 1 and the SIT. Spatially and temporally heterogeneous concentrations of cobalt and molybdenum around the Multiunit 1 are discussed in Section 4.2 and supported with updated plume maps (**Figures 4-1 through 4-4**).

Transducers were installed in wells upgradient and downgradient of SIT to record water level changes in the area at a greater frequency than twice a year. Water level data collected from wells located downgradient of the SIT are compared to the water level data collected from wells located upgradient of the SIT to evaluate the performance of the SIT in collecting seepage migrating downgradient from the Multiunit 1. Wells equipped with transducers to monitor water levels are identified in **Table 1-2** and hydrographs of the groundwater elevations recorded at these locations are included in **Appendix L**. Water levels in wells upgradient of the SIT are 10 to 30 ft higher than water levels at wells downgradient of the SIT, which suggests the SIT is performing as designed and preventing contaminated groundwater from migrating toward downgradient receptors, such as the Chaco Wash. MW-57 and MW-87 had equipment failures in the transducer connection and data was not collected the second half of the year. MW-06R and MW-05 equipment failures have resulted in no data collected for those sites since January 2024 and November 2022, respectively.

Data collected from the flow monitoring station installed within Chaco Wash is compared to water levels downgradient of the SIT to evaluate the relationship between water in the Chaco Wash and groundwater located downgradient of the SIT. Water levels in Chaco Wash measured in 2024 were higher than water levels in several adjacent wells. The water levels support the CSM and indicate that Chaco Wash is a losing reach along the Site boundary during select periods of the year and that surface water infiltration could influence groundwater quality in these wells.

Additional Monitoring and Extraction wells at the URS. APS completed the installation of four wells north of the URT that included two supplementary monitoring wells (URS-05 and URS-08) and two inactive extraction wells (URS-06 and URS-07). Installation of the wells began in December 2023 and development was completed in January 2024. A technical report documenting that work, dated March 27, 2024, with an addendum dated April 4, 2024 is included in **Appendix A**.

Exposure Assessment and Risk Evaluation at Multiunit 1 and the URS. During the 2024 reporting period, APS initiated an evaluation of human health and environmental risk associated with URS and Multiunit 1 COCs at levels above the GWPS to support an assessment of remedy protectiveness. A site-specific conceptual exposure model and step wise risk screening analysis will be developed and recommendations will be presented in a technical memorandum in 2025.

4.4.2 REMEDY SELECTION REPORTS FOR MULTIUNIT 1 AND THE URS

During the reporting period, APS further progressed selection of remedies for Multiunit 1 and the URS that meet the requirements of 40 CFR §257.97(b) while considering the evaluation factors of 40 CFR §257.97(c). Preparation of a remedy selection report began in 2023 and is planned to be completed in 2025.

4.5 SEMI-ANNUAL PROGRESS REPORT ON REMEDY SELECTION FOR MULTIUNIT 1 AND THE URS

40 CFR §257.97(a) requires the preparation of semi-annual reports, which document the progress of remedy selection for CCR units that have potentially impacted groundwater until the remedy is selected. Accordingly, a semi-annual report was prepared during the reporting period on July 15, 2024, which describes the progress of remedy selection for Multiunit 1 and the URS. This semi-annual report is included as **Appendix M**.

The GMCAR for 2024 fulfills the requirements of 40 CFR §257.97(a) for a subsequent semi-annual progress report by providing updates on remedy selection (Section 4) and future planned activities (Section 5) for the Multiunit 1 and the URS.

4.6 CCR UNIT CLOSURE ACTIVITIES

During the reporting period, APS progressed CCR unit closure activities as outlined in the following sections.

4.6.1 URS CLOSURE

As documented in previous annual reports, APS provided notice of its intent to close the URS on December 10, 2018, pursuant to 40 CFR §257.101(a)(1) and §257.101(b)(1). The unit is currently in the closure process per the unit's closure plan (AECOM, 2016), which states the URS will be closed by removal. The URS has been demolished and both CCR and visually impacted soil underlying the unit were removed as of December 14, 2018. A new concrete tank (referred to as the URT) was constructed to serve the function of the URS and was placed in service on December 10, 2018. Until May 2024 when 40 CFR §257.102(c) was revised to allow groundwater corrective action during the post-closure care period, closure of the URS was not considered complete until concentrations of fluoride in groundwater downgradient of the unit decline to less than the GWPS for the constituent. An update of the URS closure plan will be prepared in 2025 to address the regulatory change.

Interim response measures (Section 4.3) have been implemented to address elevated concentrations of fluoride in the vicinity of the former URS while a formal remedy selection process progresses. The SDAWP update prepared during the 2022 reporting period specifically addresses unit closure statistical evaluation procedure to be used once concentrations decline to a level supporting analysis.

4.6.2 CWTP CLOSURE

APS provided notice of its intent to close the CWTP on November 23, 2020, pursuant to 40 CFR §257.101(a)(1) and §257.101(b)(1). The unit had not triggered corrective action and was in detection monitoring at the time discharges to the unit ceased; however, the unit transitioned into assessment monitoring in April 2023. Upon suspension of discharges to the CWTP, flows were directed to a new sedimentation tank system constructed to serve the function of the CWTP (i.e., treatment of ash-impacted wastewater).

The CWTP is being closed in accordance with its closure plan (AECOM, 2016), which includes closure by removal of CCR solids through mechanical excavation and hydraulic dredging. APS completed dredging of the CWTP during the reporting period and will complete the documentation of closure activities related to the work in 2025.

4.6.3 MULTIUNIT 1 CLOSURE

APS provided notice of its intent to close the LAI/LDWP (Multiunit 1) on April 10, 2021, pursuant to 40 CFR §257.101(a)(1). Discharges to the LAI (principally flue gas desulfurization waste) were suspended at that time and have since been blended with ash and placed in the DFADA.

The closure plans for the LAI (AECOM, 2016) and LDWP (AECOM, 2016) state that CCR in these units will be closed in place and capped with an evapotranspiration cover. Dewatering of the units must occur prior to capping to safely construct the final cover system. During the reporting period, geotechnical assessment of the deposits in the LAI continued to support cover system design with placement of lightweight aggregate material in multiple test roads. The test roads have been constructed on the LAI surface to provide access for the installation of new dewatering and observation wells into the CCR above the liner. A pilot dewatering well study was completed in July 2023. Two additional phases of dewatering wells were installed in 2024, with documentation planned for completion in 2025. Declining surface water levels in the LDWP indicate that flows into the LDWP from the LAI have significantly decreased; ponded water covers less than a quarter of the LDWP footprint as of the end of 2024.

Planned activities for 2025 include continuing to construct access roads onto the LAI and install more extraction wells, completion of cover system design, rerouting of LAI discharges (i.e., decant tower and toe drain seepage) from the LDWP to the RWP, and initiation of stormwater improvements supporting unit closure. Design drawings were developed in anticipation of contractor procurement activities scheduled for early 2025.

5 KEY ACTIVITIES FOR 2025

During 2025, the following key activities will likely be conducted to support CCR groundwater monitoring and corrective action compliance at the Site:

- *Preparation of an Annual Groundwater Monitoring and Corrective Action Report for 2025* – Per 40 CFR §257.90(e), an annual report must be prepared no later than January 31 of the year following the calendar year documented in the report.
- *Continued Detection Monitoring at the DFADA and RWP with Evaluation for SSIs over Background* – Per 40 CFR §257.94(b), detection monitoring (including analysis of collected samples for Appendix III constituents) must continue on a semi-annual basis. On an ongoing basis, it will be determined whether there has been an SSI over background at the CCR units undergoing detection monitoring within 90 days of sampling and analysis (40 CFR §257.93[h][2]).
- *Initiation of Assessment Monitoring for CCR Units with an SSI over Background (as applicable)* – Per 40 CFR §257.94(e)(1), within 90 days of detecting an SSI over background levels for any Appendix III constituent, an assessment monitoring program must be established.
- *Continued Assessment Monitoring at CWTP, Multiunit 1, and the URS* – While corrective action evaluation progresses, assessment monitoring (including analysis of collected samples for Appendix III and Appendix IV constituents) must be conducted on a semi-annual basis at the Multiunit 1 and the URS per 40 CFR §257.95(b) and (d)(1). At the CWTP, assessment monitoring will be conducted until concentrations of Appendix III constituents no longer exceed background values per 40 CFR §257.95(f) and closure of the unit has been certified.
- *Preparation of Report Documenting the Dredging of the CWTP* – Hydraulic dredging was completed in 2024 and a report documenting the work will be prepared in 2025. Groundwater monitoring will continue through the closure process.
- *LAI and LDWP Closure Activities* – Closure activities for 2025 include continuing construction of access roads onto the LAI, the installation of more extraction wells, completion of cover system design, rerouting of LAI discharges (i.e., decant tower and toe drain seepage) from the LDWP to the RWP, and initiation of stormwater improvements supporting unit closure.
- *Preparation of Remedy Selection Report* – APS will select remedies for Multiunit 1 and the URS that meet the requirements of 40 CFR §257.97(b) and document the selection process in a remedy selection report prepared for each unit per 40 CFR §257.97(a).
- *Initiation of Remedial Activities* – Per 40 CFR §257.91(f), remedial activities at Multiunit 1 and the URS will begin within 90 days of selecting a remedy for each unit.
- *Pump Installation at URS-06 and URS-07* – APS will design and construct pumping systems in URS-06 and URS-07 that will pipe the extracted seepage water to the URT.
- *Installation of an Additional Multiunit 1 Weathered Lewis Shale/Alluvium Background Well* – To support the ongoing evaluation of the adequacy of background wells in the Weathered Lewis Shale/Alluvium, APS will conduct an investigation to identify additional background monitoring wells in 2025.

Because the nature of corrective actions is implemented in phases based on analysis of data collected on an ongoing basis, the foregoing list of activities to be completed in 2025 only includes reasonably probable activities that will occur in 2025; APS will adapt as necessary based on available data, daily operations and changes in regulation.

TABLES

Table 1-1
Description of Coal Combustion Residuals Units

| CCR Unit | Location | Function | Operation | Size/Construction | History |
|--|---|---|--|--|--|
| Upper Retention Sump (URS) <i>Closure Initiated</i> | <i>Plant Area</i> NW 1/4 of Section 36, T29N, R16W | <i>Single CCR unit</i> . Impoundment. Surge pond for FGD system. | FGD system discharge was discharged into the sump via 10 plus controlled/monitored lines. Pond contents were recirculated back into the FGD process via a pump chamber located on the south end of the pond. Solids were periodically removed from the sump. | - 1.07 acres in areal extent - Soil-cement liner on bottom and inside slopes | Placed in service around 1983. Discharges to the unit ceased as of December 10, 2018 and were thereafter directed to a new concrete tank (i.e., the Upper Retention Tank) that is located within the former footprint of the URS and serves the function of the former unit. Closure activities conducted in 2018 included removal of CCR and associated impacted materials from the URS with placement in the DFADA prior to backfilling the area with clean fill. |
| Combined Waste Treatment Pond (CWTP) <i>Closure Initiated</i> | <i>East of Plant, Adjacent to Morgan Lake</i> SE 1/4 of Section 25, T29N, R16W | <i>Single CCR Unit</i> . Impoundment. Detention pond used for NPDES treatment; settling and stabilization basin for ash-impacted and other Plant wastewater flows prior to discharge to Morgan Lake in accordance with an NPDES permit. | The primary source of water to the CWTP was from hydrobins which separated transport water from bottom ash generated in plant Units 4 and 5. Seven earthen basins in the western edge of the CWTP promoted sediment settling prior to the water decanting into the main portion of the CWTP and then overflowing into the cooling water discharge canal at the northeast corner of the pond. | - 13.4 acres in areal extent | Constructed in 1978. Discharges to the unit ceased as of November 23, 2020 and were thereafter directed to a new concrete tank (i.e., the Bottom Ash Sluice Water Recycle Tank) that is located northeast of the coal storage area. CCR removal from the unit was initiated in 2022. |
| Lined Ash Impoundment (LAI) <i>Closure Initiated</i> | <i>Disposal Area</i> E 1/2 of Section 34, T29N, R16W | <i>Part of a CCR multiunit with the LDWP</i> that received fly ash, flue gas desulfurization (FGD) waste and associated residuals as a slurry from the plant. | Waste was discharged into the pond in the northeast portion of the pond. Decanted flow discharged via a vertical drop inlet structure and through a toe drain into the LDWP. | - 126.8 acres in areal extent (high water line) - 60 mil HDPE liner - 5,364 acre-ft design capacity - 5,275.2 ft AMSL maximum working level | Constructed on top of closed Ash Ponds 4 and 5 and placed in service in 2004. Discharges to the unit ceased as of April 10, 2021 and were thereafter blended with dry fly ash and placed in the DFADA. |
| Lined Decant Water Pond (LDWP) <i>Closure Initiated</i> | <i>Disposal Area</i> E 1/2 of Section 34, T29N, R16W | <i>Part of a CCR multiunit with the LAI</i> that received decanted water from the LAI. Impoundment. | Decanted water was discharged into the pond from the LAI via gravity; the water was pumped from the LDWP back to the plant for reuse in operations. | - 45 acres in areal extent - Two 60 mil HDPE liners separated by a leak detection layer - 435 acre-ft design capacity - 5,213.2 ft AMSL maximum working level | Constructed on top of closed Ash Pond 3 and placed in service in 2004. Notice of intent to close provided on April 10, 2021. |

Table 1-1
Description of Coal Combustion Residuals Units

| CCR Unit | Location | Function | Operation | Size/Construction | History |
|---|---|--|--|---|---|
| Dry Fly Ash Disposal Area (DFADA) Active | Disposal Area SE 1/4 of Section 34, T29N, R16W | Single CCR unit. Landfill. Disposal of dry fly ash, bottom ash, FGD (blended with CCR solids), and construction debris. | The DFADA is filled in general accordance with a stacking plan. Leachate generated from the DFADA cells is pumped into trucks and used for dust control. | - 4 conjoined cells (DFADA 1, 2, 3 and 4) with an areal extent of 137.7 acres total - 8,028 acre-ft design capacity - DFADA 1: compacted clay overlain by 60 mil HDPE liner and drainage layer - DFADA 2, 3 and 4: geosynthetic clay liner overlain by 60 mil HDPE liner and drainage layer - Leachate collection system drains each DFADA cell | Constructed in 2007 (DFADA 1), 2012 (DFADA 2), 2014 (DFADA 3) and 2021 (DFADA 4). |
| Return Water Pond (RWP) Active | Plant Area NW 1/4 of Section 36, T29N, R16W | Single CCR unit. Lined impoundment for the temporary storage of FGD system waste, drain down from the LAI, treated sewage wastewater flow, and water pumped from the site seepage collection system. | The RWP consists of two cells; FGD system waste generated at the plant can be discharged into an FGD cell while all other liquids are discharged into a liquid cell. A spillway between the two cells allows liquid in the FGD system waste to decant into the liquid cell. Liquids from the liquid cell are pumped back to the plant for reuse in plant operations. | - 5.1 acres in areal extent - Composite liner system and associated LCRS comprised of a primary 60 mil HDPE liner, a geosynthetic drainage layer, a secondary 60 mil HDPE liner, and an underlying geosynthetic clay liner - 38.6 acre-ft design capacity - 5379 ft AMSL maximum working level | Constructed in 2019 and placed into service November 2020. |

Abbreviations:

AMSL - above mean sea level

CCR - Coal combustion residuals

CWTP - Combined Waste Treatment Pond

DFADA - Dry Fly Ash Disposal Area

FGD - flue gas desulfurization

ft - feet

HDPE - high density polyethylene

LAI - Lined Ash Impoundment

LCRS - leak collection and removal system

LDWP - Lined Decant Water Pond

NPDES - National Pollutant Discharge Elimination System

RWP - Return Water Pond

URS - Upper Retention Sump

Notes and Abbreviations:

Source of presented information is AECOM, 2017 and Sakura Engineering & Surveying, 2017, 2019, and 2020.

Vertical datum is NAVD 88

¹ - Water level monitored via transducer

² - Estimated

³ - New surveyed elevation after wellhead modifications

⁴ - Well has not been surveyed as of January 31, 2024

⁵ - MW-34 is also designated EW-34 on previous reports

Wells highlighted gray were abandoned

AMSL - Above mean sea level

NA - Data Not Available

bgs - below ground surface

NM - Not Measured as of January 31, 2024

CCR - coal combustion residual(s)

RWP - Return Water Pond

CWTP - Combined Waste Treatment Pond

URS - Upper Retention Sump

DFADA - Dry Fly Ash Disposal Area

ft - feet

Well Designation Descriptions:

Background - Monitoring location used to determine background groundwater quality that has not been affected by the CCR unit under investigation (40 CFR §257.91)

Downgradient - Monitoring location used to evaluate the nature and extent of groundwater conditions associated with each CCR unit

Downgradient Boundary - Monitoring location used to assess the groundwater conditions at the boundary of each CCR unit

Extraction - Well location that currently supports the hydraulic containment system with the extraction of groundwater located downgradient of a CCR unit

Extraction (Inactive) - Well location installed to assist with the extraction of groundwater that does not actively support the current hydraulic containment system

Supplementary - Monitoring location intended to further support interpretations of both immediate CCR Unit-area conditions and Site-wide conditions

Notes:

¹ Units are standard units

² Units are picocuries per liter

³ BTVs identified for the DFADA used background wells, MW-49A and MW-74, as presented in the CCR Monitoring Well Network Report and Certification (AECOM, 2017)

Abbreviations:

BTV - Background Threshold Value

CWTP - Combined Waste Treatment Pond

Table 3-1
Appendix III and Appendix IV Constituent BTVs and/or GWPSs for Four Corners CCR Units
Semiannual 1 Event 2024

GWPS - Groundwater Protection Standard

LPL - lower prediction limit

mg/L - milligrams per liter

N/A - not applicable RL - reporting limit

UPL - upper prediction limit URS - Upper Retention Sump

Notes:

^(a) Background wells for the CWTP, RWP, and URS.

^(b) Totals exclude field duplicate samples.

X - Well Monitored

--- - Well Not Monitored

¹Well contained no groundwater and was measured dry during the sampling event

²Well was abandoned in June 2023

³Well installed in June 2023

⁴Well was not configured for sampling

⁵Well contained an insufficient amount of groundwater to support sample collection

⁶Obstruction present in the well prevented sample collection

Abbreviations:

App - Appendix

CCR - coal combustion residuals

CWTP - Combined Waste Treatment Pond

DFADA - Dry Fly Ash Disposal Area

Monitoring Point Type Descriptions:

Background - Monitoring location used to determine background groundwater quality that has not been affected by the CCR unit under investigation (40 CFR §257.91)

Downgradient - Monitoring location used to evaluate the nature and extent of groundwater conditions associated with each CCR unit

Downgradient Boundary - Monitoring location used to assess the groundwater conditions at the boundary of each CCR unit

Table 3-3

CCR Groundwater Monitoring Event Summary for 2024

| | |
|----------------------------|--|
| SA - Semi-annual | Extraction - Well location that currently supports the hydraulic containment system with the extraction of groundwater located downgradient of a CCR unit |
| RWP - Return Water Pond | Extraction (Inactive) - Well location installed to assist with the extraction of groundwater that does not actively support the current hydraulic containment system |
| URS - Upper Retention Sump | Supplementary - Monitoring location intended to further support interpretations of both immediate CCR Unit-area conditions and Site-wide conditions |

Table 3-4
Aquifer Properties and Groundwater Flow Calculations

| Hydrogeologic Unit (CCR Unit) | Estimated Hydraulic Conductivity [ft/d] | Estimated Effective Porosity [Vol/Vol] | Sampling Event | Calculated Hydraulic Gradient [ft/ft] | Calculated Groundwater Flow Direction [degrees from North] | Estimated Groundwater Flow Rate [ft/d] |
|-------------------------------------|--|---|----------------|--|---|---|
| Pictured Cliffs Sandstone (URS) | 6.0 ^(a) | 0.25 ^(b) | May 2024 | 0.0003 | 346 | 0.01 |

CERTIFICATION STATEMENT

I, Rebecca A. Weaver, as a qualified groundwater scientist and professional engineer have reviewed this report titled URS-05, URS-06, URS-07, and URS-08 Well Completion Report, Four Corners Power Plant, Fruitland, New Mexico, Project # 14-2018-2030 dated March 27, 2024. I certify that the groundwater monitoring system components that are documented in this report have been designed and constructed for the Arizona Public Service Company Four Corners Power Plant as required for compliance with coal combustion residuals (CCR) groundwater monitoring and corrective action requirements detailed in 40 Code of Federal Regulations (CFR) Part 257.

1 INTRODUCTION

On behalf of Arizona Public Service Company (APS), WSP USA Environment & Infrastructure (WSP) prepared this Well Completion Report to document the siting, drilling, installation, and development of two new extraction wells and two new monitoring wells at the Four Corners Power Plant (the Plant or the Site) in Fruitland, New Mexico. This report documents well installation activities required by 40 Code of Federal Regulations (CFR) Part 257 and Subpart D - Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments (herein referred to as the Coal Combustion Residuals (CCR) Rule [Federal Register, 2020]) and as part of the interim corrective measures at the Upper Retention Sump (URS). The new extraction wells, URS-06 and URS-07, and new monitoring wells, URS-05 and URS-08, were installed to augment the current URS seepage extraction system and the monitoring well network north of the Upper Retention Tank (URT).

1.1 SITE DESCRIPTION

A description of the setting of the Site and its impact on the wells installed for the project are included in the following subsections. **Figure 1** presents an overview of the Site location and the locations of the wells in relation to other Site features are included on **Figure 2**.

1.1.1 FACILITY DESCRIPTION

The Site is an operating power plant located approximately 20 miles southwest of the city of Farmington, New Mexico. The plant burns low sulfur coal in two electrical generating units (Units 4 and 5) and has a net generating capacity of 1,540 megawatts. The Plant formerly had five generating units and a capacity of 2,040 megawatts; Units 1, 2, and 3 were retired in December 2013 and decommissioned between 2014 and 2016. Coal burned at the plant is generally sourced from the nearby Navajo Mine (**Figure 1**) (Navajo Transitional Energy Company, 2016).

The URS was an approximate 1-acre surge pond for process water associated with the Plant's flue-gas desulfurization (FGD) system, which contained elevated levels of fluoride. The URS was placed into service around 1983. The URS was dewatered and demolished between June and December 2018 and subsequently replaced by the URT in 2018.

1.1.2 ENVIRONMENTAL SETTING

Unless otherwise noted, the following information is abstracted from AECOM, 2017.

Climate. The plant is located in a semi-arid climate on the western flank of the San Juan Basin. The area receives an average of 8.6 inches of precipitation and 12.6 inches of snow per year.

Topography. The main plant area of the Site is located at an elevation of approximately 5,340 to 5,360 feet (ft) above mean sea level (amsl). The topography of the Site area is characterized by rolling terrain, steep escarpments, and incised drainages/arroyos. In the vicinity of the Plant, the ground surface is relatively flat, sloping to the west at approximately 20 feet per mile with the exception of surface drainage immediately near Morgan Lake, which flows towards the lake. About one mile west of the plant, the level ground surface drops rapidly to 5,200 ft amsl. Chaco Wash (sometimes referred to as the Chaco River) is located west of this abrupt change in elevation and ephemerally flows north to the San Juan River.

Surface Water Hydrology. The Site is situated on the southern bank of Morgan Lake, an approximately 1,300-acre man-made lake that has a maximum storage capacity of 39,000 acre-ft of water and supplies cooling water to the plant. Morgan Lake was formed by damming a westerly flowing stream (now known as 'No Name Wash') and is replenished by an underground pipeline (i.e., aqueduct) that routes flow from the San Juan River located approximately 3 miles north of the Site. The typical water surface elevation of the lake is 5,330 ft amsl. Morgan

Dam discharges to ‘No Name Wash’ which flows west of the lake to Chaco Wash. Chaco Wash is a northward-flowing tributary of the San Juan River and is located west and hydraulically downgradient of the Site.

Site Geology. The Site is located in the northwestern boundary of the San Juan Basin, which is a structural depression that lies at the eastern edge of the Colorado Plateau (Dames & Moore, 1988). The dominant geographic feature in the vicinity of the Site is the Hogback Monocline located to the west of the plant; this monocline is a steep (38 degree) eastward-dipping flank composed of Cretaceous sedimentary rock (Dames & Moore, 1988).

The geological units relevant to the new wells in the URS include (in descending stratigraphic order): the Pictured Cliffs Sandstone and the Lewis Shale. Detailed descriptions of these units are included in the *Annual Groundwater Monitoring and Corrective Action Report for 2023* (WSP, 2024). The Pictured Cliffs Sandstone is a fine- to medium-grained sandstone and is the uppermost geologic unit that underlies the URS. The Pictured Cliffs Sandstone is approximately 30 to 60 ft thick in the area of the URS. The lower portions of Pictured Cliffs Sandstone represent a transitional sequence between the unit and the underlying Lewis Shale as indicated by alternating beds of sandstone and shale. The Lewis Shale is a marine shale that contains weathered shale subunit (Weathered Lewis Shale) which overlies a hard, unweathered shale subunit (Unweathered Lewis Shale). The thickness of the weathered shale subunit varies between 11 and 47 ft within the vicinity of the Site. However, the weathered shale subunit is observed to be significantly thinner near the URS where it underlies the Pictured Cliffs Sandstone and the boundary between the Weathered Lewis Shale and the Unweathered Lewis Shale is less defined in the area of the URS compared to other areas at the Site. The Weathered Lewis Shale and the Unweathered Lewis Shale are considered one unit (Lewis Shale) for the purpose of this investigation.

Applicable Hydrostratigraphy. The Pictured Cliffs Sandstone and Lewis Shale constitute the two general hydrostratigraphic units which are conceptualized beneath the URS that have potential to interact with releases from the URS. The Pictured Cliffs Sandstone is the uppermost water-bearing unit at the URS. Groundwater in the Pictured Cliffs Sandstone is locally influenced by Morgan Lake (at a surface elevation of approximately 5,330 ft amsl) and operations at the Plant (e.g., the former URS and the Combined Waste Treatment Pond [CWTP]) and generally flows northward towards the lake. The Lewis Shale is a regionally extensive confining unit that forms the base of the uppermost aquifers at the URS. While moisture has been observed in the Lewis Shale in the area of the URS, it is generally observed to be dry. The base of the uppermost water-bearing unit beneath the URS is marked by a 0.5 to 1 ft thick limestone bed, which has been observed along the contact between the Pictured Cliffs Sandstone and the Lewis Shale in previous drilling projects at the URS (Wood, 2021).

Past investigations indicate the transmissivity of the water-bearing zone of the Pictured Cliffs Sandstone varies laterally across the area of the URS. For example, the screened intervals of CM-01 through CM-04 were installed at approximately the same elevation, in moisture zones located at the base of the Pictured Cliffs Sandstone (above the limestone bed at the base of the Pictured Cliffs Sandstone). However, sustainable pumping rates were only attainable at CM-01 and CM-02 during well development, while CM-03 and CM-04 were both unable to support development pumping due to low yield (Wood, 2021). The extent and connectivity of transmissive zones within the water-bearing portion of the Pictured Cliffs Sandstone is not defined.

1.2 BASIS FOR WELL INSTALLATION

A detailed description of the Site and background information is provided in the *Annual Groundwater Monitoring and Corrective Action Report for 2023* (WSP, 2024). Pursuant to CCR Rule requirements, APS currently operates a groundwater extraction system at the URS as part of corrective measures in response to fluoride groundwater protection standard (GWPS) exceedances detected at the URS. The groundwater extraction system currently consists of two groundwater extraction wells (CM-01 and CM-02), which remove groundwater at a combined extraction rate of approximately 2 gallons per minute (gpm).

The current extraction rate of the URS groundwater extraction system was utilized by WSP during the development of a calibrated flow and transport model, which forecast the fate and migration of fluoride at the URS for 30 years (WSP, 2023). At the 2 gpm extraction rate, fluoride concentrations at selected monitoring locations located around the URS were estimated to remain above 4 milligrams per liter (mg/L) (the current Groundwater Protection Standard [GWPS] for fluoride at the URS) for durations as short as 4.4 years (at MW-69), and as long as 18.3 years (at CM-04) (WSP, 2023). As indicated in the 2023 technical memorandum summarizing

the updates to the flow and transport model, the addition of two extraction wells located north of the URT operating at an additional combined extraction capacity of 2 gpm could improve the removal of groundwater in the area of elevated fluoride concentrations and significantly decrease the time to achieve the GWPS in the area near the URS (WSP, 2023). Two new groundwater extraction wells, URS-06 and URS-07, installed north of the URT, were installed for this purpose. Two additional monitoring wells, URS-05 and URS-08, were installed to supplement the existing groundwater monitoring network at the URS.

2 WELL INSTALLATION ACTIVITIES

The installation activities for URS-05, URS-06, URS-07, and URS-08 are summarized in the following sections. Lithologic logs and well construction diagrams are included in **Appendix A**. A photographic log showcasing well installation activities is included in **Appendix B**. A map with the location of the new wells is included as **Figure 2**.

2.1 PRE-MOBILIZATION ACTIVITIES

Prior to site mobilization, all required Notice of Intent to Drill permits were filed with the Navajo Department of Water Resources (NDWR). NDWR permits are included in **Appendix C**. WSP also prepared a Health and Safety Plan (HASP) for the field operations and ensured that all WSP field personnel and subcontractors received APS Fossil Generation Contractor Safety training. WSP contracted with a licensed New Mexico driller, Cascade Environmental (Cascade; license no. 1664) to conduct the well drilling activities.

2.2 WELL SITING

The four new wells were sited downgradient of the former URS footprint within the current extent of the fluoride plume at the URS to intercept groundwater containing concentrations of fluoride exceeding the GWPS for the URS (4.0 mg/L). Specifically, the wells were cited to be installed north of the northern boundary of the URT and south of existing well MW-66, within the north-central and north-eastern portion of the current extent of the fluoride plume, and downgradient of the URS (**Figure 3**). Extraction wells sited at this location will intercept groundwater within the central portion of the fluoride plume in an area downgradient of the former extent of the URS. Additionally, the extraction wells are located in the vicinity of the existing seepage extraction system to enable their future connection to the system, as applicable. Monitoring wells sited at the described location will supplement efforts to characterize the groundwater conditions within the northern portion of the fluoride plume at the URS. Specifically, the monitoring wells will characterize the extent of the northwestern portion of the fluoride plume between existing wells MW-66 and MW-70.

The land on which the wells are located is part of the Navajo Nation and is currently utilized by the Navajo Transitional Energy Company (NTEC) as the Navajo Mine. All wells are located within the boundary of a haul road located approximately 30 feet north of the URT. The haul road is an active road that services the Four Corners Power Plant and the Navajo Mine, so the wells were installed along the northern and southern boundaries of the road to not obstruct vehicular passage along the road. The approximate location of each well, which were measured with a handheld global positioning unit (gps) unit after well construction was completed, are included on **Figures 2 and 3**.

2.3 WELL DRILLING

Well drilling activities occurred between December 7 and December 19, 2023. Prior to drilling, utility clearance was performed by GPRS, LLC on December 5, 2023. Hydro-excavation was performed by Riley Industrial Services, Inc. on December 6 and 7, 2023, with assistance from Cascade to clear concrete and rebar associated with the haulage road. Boreholes were cleared to depths 6 ft below ground surface (bgs) or greater. Concrete thickness varied from 5 inches to 3.5 ft. Cascade performed onsite drilling using a 600-T Sonic Drill Rig. WSP field personnel observed and documented drilling activities, including lithologic logging, well construction, and pumping. Additionally, WSP field personnel monitored water level infiltration rates using a handheld water level meter once drilling was completed and prior to well construction at each borehole location. Infiltration rates are calculated in **Table 1**.

2.3.1 URS-05

Drilling of the URS-05 borehole began December 12, 2023. The borehole was completed to 50 ft bgs on December 13, 2023. The Pictured Cliffs Sandstone was present from below the hydro-excavated zone of 6 ft bgs to approximately 37 ft bgs. Gravels were present at approximately 11-12 ft bgs. Gypsum nodules were also encountered at 18-20 ft bgs. The contact between the Pictured Cliffs Sandstone and the Lewis Shale was observed at approximately 37 ft bgs and a limestone bed was observed at the top of the Lewis Shale from 38-42 ft bgs. Groundwater was identified at approximately 35 feet bgs and was present until reaching the limestone unit observed within the Lewis Shale at approximately 38 feet bgs for a total saturated thickness of 3 ft at the base of the Pictured Cliffs Sandstone.

After the borehole was drilled to a total depth of 50 ft bgs, the drill casing was retracted to above the top of the observed moisture zone at 30 ft bgs, to allow groundwater to infiltrate from the surrounding formation to the borehole. WSP field personnel recorded water levels every 10 minutes for approximately 60 minutes, during which time the measured depth of groundwater rose from 34.08 ft bgs to 33.38 ft bgs for an average infiltration rate of 0.0125 feet per minute (ft/min) (Table 1).

2.3.2 URS-06

Drilling of URS-06 borehole began December 14, 2023. The borehole was completed to 50 feet bgs the same day. Pictured Cliffs Sandstone was present from below the hydro-excavated zone of 6 ft bgs to approximately 35 ft bgs. Trace amounts of gravels were present at approximately 7.5-8.5 ft bgs. Small gypsum nodules were also encountered at 11-18 ft bgs and 21-22 ft bgs. The Lewis Shale contact was at approximately 35 ft bgs. Concretionary, fossiliferous limestone was present at the top of the Lewis Shale from 35-40 ft bgs. Groundwater was identified at approximately 32 ft bgs and was present until reaching the limestone unit observed within the Lewis Shale at approximately 35 ft bgs for a total saturated thickness of 3 ft at the base of the Pictured Cliffs Sandstone.

After Cascade had drilled the borehole to a total depth of 50 ft bgs, the bottom of the drill casing was pulled to above the top of the observed moisture zone at 30 ft bgs to allow groundwater to infiltrate from the surrounding formation to the borehole. Groundwater levels were monitored for approximately 35 minutes, during which time groundwater rose from 46.10 to 34.41 ft bgs for an average infiltration rate of 0.3340 ft/min (Table 1).

2.3.3 URS-07

The drilling for the URS-07 borehole began December 7, 2023. The drill bit got stuck in limestone during drilling and required repairs as a result, which delayed completion of the borehole until December 11, 2023. The total depth of the borehole was measured at 51 ft bgs. The Pictured Cliffs Sandstone was observed between 10-30 ft bgs. Gravels and cobbles were observed at 18-19 ft bgs. The contact between the Pictured Cliffs Sandstone and the Lewis Shale was observed at approximately 30 ft bgs. However, the contact was observed to be gradational between 30-51 ft bgs and was marked by alternating layers of limestone, silt, and shale. The limestone layers were observed at the following intervals: 30-31 ft bgs, 35-36 ft bgs, 37-38 ft bgs, and 45-48 ft bgs. A moisture zone was observed above the contact between the Pictured Cliffs Sandstone and Lewis Shale between 27-30 ft bgs for a total saturated thickness of 3 feet at the base of the Pictured Cliffs Sandstone. Water was observed between the limestone layers within the Lewis Shale between 31-35 ft bgs. However, the water observed in the Lewis Shale was likely residual water which remained from efforts taken to free the drill from the limestone unit. The borehole was flooded December 11, 2023, in an effort to dislodge the drill bit from the limestone unit and water used in the effort likely impacted drill cuttings near the top of the Lewis Shale.

After Cascade completed drilling the borehole to a total depth of 51 ft bgs, the bottom of the drill casing was pulled to above the top of the observed moisture within the Pictured Cliffs Sandstone at 27 ft bgs. Groundwater levels were monitored every 10 minutes for approximately 2 hours and 20 minutes to assess the rate of groundwater infiltration. Groundwater rose from 53.20 ft bgs to 42.56 ft bgs at an average infiltration rate of 0.133 ft/min (Table 1).

2.3.4 URS-08

The drilling for the URS-08 borehole began on December 15th, 2023. The borehole was completed to 50 ft bgs the following day, December 16th. The Pictured Cliffs Sandstone was present from 8 ft bgs, to approximately 43 ft bgs. Trace amounts of gypsum nodules were also encountered at 21 ft bgs. The contact between the Pictured Cliffs Sandstone was observed at approximately 43 ft bgs, however, a zone of interbedded layers of sandstone and clay/shale was observed between 30-43 ft bgs, indicating the contact between the two units is likely gradational in the location of URS-08. Intermittent zones of moisture were observed in the Pictured Cliffs Sandstone between 30-32 ft bgs, 37-37.5 ft bgs, 38-40 ft bgs, and 41-43 ft bgs. Concretionary, fossiliferous limestone was present in the Lewis Shale from 43-45 ft bgs.

After Cascade had drilled the borehole to a total depth of 50 feet bgs, the bottom of the drill casing was pulled to above the top of the observed moisture within the Pictured Cliffs Sandstone at 30 ft bgs. WSP obtained water levels for 30 minutes with the initial recording at 35.23 ft bgs and with the last measurement at 30.44 ft bgs for an infiltration rate of 0.1545 ft/min (**Table 1**).

2.4 WELL CONSTRUCTION

Wells were constructed by Cascade using threaded, schedule (SCH) 80 PVC casing and screen materials. Well construction details can be found on **Table 2** and construction diagrams are included in **Appendix A**.

2.4.1 WELL CONSTRUCTION SELECTION

The decision regarding which boreholes would be constructed as extraction or monitoring wells was determined by several factors, including the well location, groundwater observed in the borings, and post-drilling measurements of groundwater infiltration rates, which is indicative of transmissivity. The groundwater infiltration rate in URS-06 was the highest measured (0.3340 ft/min) in the four new wells. URS-07, situated at the easternmost position among the new wells, afforded a wider lateral extent for maximizing groundwater capture and exhibited an acceptable groundwater infiltration rate of 0.1330 ft/min. The positions of the extraction wells and monitoring well screens were strategically located to intercept the water bearing portion of the Picture Cliffs Sandstone.

2.4.2 EXTRACTION WELLS

Extraction wells URS-06 and URS-07 are each constructed of 6-inch nominal size flush threaded SCH 80 PVC blank casing and screen with 0.020-horizontal slot openings. URS-06 was constructed to a total depth of 45 ft bgs and URS-07 was constructed to a total depth of 50 ft bgs. The extraction well casing and screen assemblies consist of 22 ft and 27 ft of blank casing above the screen (at URS-06 and URS-07, respectively) and a 5 ft blank casing sump below the screen, with a total screen length of 20 ft at both locations. Extraction well casing and screen assembly was centered in the borehole using three centralizers to provide a uniform annular space for installation of annular materials. Centralizers were placed no more than 20 ft apart.

URS-06 and URS-07 were completed with a bentonite chip seal from 41 ft bgs to total depth (TD) and 46 ft bgs to TD, respectively. A 12-20 filter pack sand extending from the top of the bentonite seal to 2 ft above the screened interval and followed by the installation of a 2 ft layer of 20-40 transition sand. Another bentonite seal 2 ft thick was installed on top of the transition sand and cement grout was installed from the top of the bentonite seal to ground surface. All annular materials were installed using a tremie pipe. Surface completions at each well consists of a 3-ft above grade 10-inch diameter steel vault placed within a 3 ft by 3 ft concrete pad.

2.4.3 MONITORING WELLS

Monitoring wells URS-05 and URS-08 are each constructed of 4-inch nominal size flush threaded SCH 80 PVC blank casing and screen with 0.020-horizontal slot openings. Each monitor well was constructed to total depths of 40 ft bgs. Each monitoring well casing and screen assembly consists of 30 ft of blank casing above the screen with a total screen length of 10 ft. Monitoring well casing and screen assembly was centered in the borehole using three centralizers to provide a uniform annular space for installation of annular materials. Centralizers were placed no more than 20 ft apart.

URS-05 and URS-08 were completed with a bentonite chip seal from 41 ft bgs to TD. A 12-20 filter pack sand extending from the top of the bentonite seal to 2 ft above the screened interval and followed by a 2 ft 20-40 transition sand was installed. Another bentonite seal 2 ft thick was installed on top of the transition sand and cement grout was installed from the top of the bentonite seal to ground surface. All annular materials were installed using a tremie pipe. Surface completions at each well consists of a 10-inch diameter flush-mount traffic rated vault.

2.5 WELL DEVELOPMENT

The URS wells were developed January 4 through January 6, 2023. Development techniques varied based on the amount of water produced at each well, but generally consisted of:

- Surging and bailing the well until the amount of sediment produced by each cycle was reduced to trace amounts; and
- Development pumping using a 12-volt Mega-Monsoon® pump.

Well development results are summarized in **Table 3** and well development field forms are included in **Appendix D**. Successful well development (which is typically defined by purging a well until water turbidity reaches less than 5 nephelometric units [NTUs] and field measurements of pH, temperature, and electrical conductivity have stabilized to 10 percent [%] or less deviation between subsequent measurements) was achieved at URS-05 and URS-06. Turbidity was not reduced to a value below 28 NTUs at URS-07. Turbidity is likely naturally elevated at wells URS-07 and URS-08 due to the presence of clay and fine-grained sediments at the water-bearing zones located within the gradational contacts between the Pictured Cliffs Sandstone and Lewis Shale at the wells. Field measurements of pH, temperature, and electrical conductivity all stabilized to 10% or less deviation between readings at URS-07, so WSP considers the well to be successfully developed. Development of URS-08 was unsuccessful due to low yield which prohibited sustained development pumping.

Average discharge rates sustained during pump development at URS-05, URS-06, and URS-07 are summarized on **Table 3**. URS-05 and URS-06 sustained the highest discharge rates, (3.0 gpm and between 1.5 and 2.0 gpm, respectively), and URS-07 sustained the lowest discharge rate (0.75 gpm), indicating the transmissivity of the water-bearing zone is greater in the western portion of the project area, near URS-05 and URS-06.

The high development discharge rate at URS-05 exceeded expectations given the low infiltration rate noted during drilling. This is likely due to the drill casing smearing clay and other fine sediments across the saturated interval (35 ft bgs to 38 ft bgs), which were subsequently cleared during development activities.

2.6 MANAGEMENT OF INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW) consisted of soil cuttings produced during drilling, which were free of coal ash, and groundwater pumped during well development. Drill cuttings were transported by trailer from the drill site to a location near the closed Ash Ponds north of the Multiunit 1, where they were disposed. The drill cuttings disposal location is included on **Figure 2**. Groundwater pumped from development activities was collected in 55-gallon drums and transferred to the URT.

3 SUMMARY AND RECOMMENDATIONS

The extraction and monitoring wells were installed within the Pictured Cliffs Sandstone hydrostratigraphic unit. The saturated thickness at the wells ranges between approximately 3 and 10 ft based on observations made during drilling and post installation water-level measurements.

Four boreholes were drilled to increase the possibility of intercepting a relatively higher transmissive zone of the water-bearing portion of the Pictured Cliffs Sandstone. Two boreholes were selected to be constructed as extraction wells based on location, total amount of groundwater observed in the borings, and groundwater infiltration rates, which were measured at each borehole location after drilling was completed and prior to well construction. Groundwater is primarily perched upon the limestone unit located at the top of the Lewis Shale, identified at depths ranging between 28 and 41 ft bgs. However, groundwater was observed to exist in multiple, layered zones throughout the gradational contact zone at URS-07 and URS-08. The contact between the two units was better-defined at URS-05 and URS-06, and groundwater was observed to reside in a better-defined zone located directly above the limestone unit at URS-05 and URS-06.

The four wells were installed as follows:

- URS-05; 4-inch diameter monitoring well with 10-inch diameter flush-mount traffic rated vault
- URS-06; 6-inch diameter extraction well with 10-inch diameter well vault with approximately 3 ft of stickup
- URS-07; 6-inch diameter extraction well with 10-inch diameter well vault with approximately 3 ft of stickup
- URS-08; 4-inch diameter monitoring well with 10-inch diameter flush-mount traffic rated vault

The wells achieved development criteria, with the exception of URS-08, which yielded too little groundwater to sustain successful pump development.

WSP recommends aquifer testing be performed at URS-06 and URS-07 prior to equipping the wells with pumps and appurtenances and connecting them to the URS seepage extraction system. Aquifer testing will provide more accurate pumping rates that can be used to select permanent pumps for the wells. Aquifer testing is also recommended at URS-05 to assess the potential suitability of the well for conversion into a groundwater extraction well, since the well sustained the highest discharge rate during development.

REF WUP NO: _____

CONDITIONS!

The following data needs to be furnished to the DEPARTMENT OF WATER RESOURCES within 30 days of completion of the well:

1. Driller's log;
2. Stratigraphic log (if done on the well);
3. Copies of all electric logs;
4. Complete water quality analysis including heavy metals and radionuclides;
5. Copy of completed well design and construction showing casing and well screen settings, gravel pack, and packer settings;
6. Cement bonding log;
7. Pump test data;
8. Copies of any special tests conducted on this well.
9. Placing a well in service without submittal of the above information will result in a penalty and possible fine.
10. Well will be utilized by local livestock permit holders in the area.

Upon submission of data listed above to the Department of Water Resources a Water Use Permit application will be processed.

ATTACH AN 8 1/2" X 11" MAP SHOWING THE LOCATION OF DRILLING

APPLICANT AGREES, AS A CONDITION AND AS CONSIDERATION FOR THE PERMIT, TO PROVIDE THE DEPARTMENT OF WATER RESOURCES, AT NO COST, THE FOLLOWING INFORMATION ON COMPLETION OF THE WELL:

- A: A COMPLETED TRIBAL "WELL RECORD" FORM WITH SUMMARY DRILLER'S LOG INFORMATION AND GEOLOGIC FORMATIONS IDENTIFIED.
- B: COPIES OF ALL WELL LOGS
- C: COPIES OF ALL CHEMICAL ANALYSES

APPLICANT AGREES, AS A CONDITION FOR THE PERMIT, TO ALLOW REASONABLE ENTRY UPON THEIR PREMISES BY DEPARTMENT OF WATER RESOURCES.

APPLICANT: WSP USA Environment & Infrastructure, Inc. on behalf of Arizona Public Service

ADDRESS: 4600 E Washington St. Ste. 600 CITY: Phoenix STATE: AZ

TELEPHONE NUMBER: (480) 258-3148 ZIP: 85034

APPLICANT'S SIGNATURE: *Andrew Whitsell* DATE: 9/26/2023

CONDITIONS!

The following data needs to be furnished to the DEPARTMENT OF WATER RESOURCES within 30 days of completion of the well:

1. Driller's log;
2. Stratigraphic log (if done on the well);
3. Copies of all electric logs;
4. Complete water quality analysis including heavy metals and radionuclides;
5. Copy of completed well design and construction showing casing and well screen settings, gravel pack, and packer settings;
6. Cement bonding log;
7. Pump test data;
8. Copies of any special tests conducted on this well.
9. Placing a well in service without submittal of the above information will result in a penalty and possible fine.
10. Well will be utilized by local livestock permit holders in the area.

Upon submission of data listed above to the Department of Water Resources a Water Use Permit application will be processed.

CERTIFICATION STATEMENT

I, Rebecca A. Weaver, as a qualified groundwater scientist and professional engineer have reviewed this report titled URS-05, URS-06, URS-07, and URS-08 Well Completion Report Addendum 1, Four Corners Power Plant, Fruitland, New Mexico, Project # 14-2018-2030 dated April 5, 2024. I certify that the groundwater monitoring system components that are documented in this report have been designed and constructed for the Arizona Public Service Company Four Corners Power Plant as required for compliance with coal combustion residuals (CCR) groundwater monitoring and corrective action requirements detailed in 40 Code of Federal Regulations (CFR) Part 257.

Signed:

Dated: April 5, 2024

This Addendum supplements the *URS-05, URS-06, URS-07, and URS-08 Well Completion Report* dated March 28, 2024. The locations of URS-05, URS-06, URS-07, and URS-08 were surveyed by Goff Engineering & Surveying, Inc. (Goff) on March 28, 2024 and several components of the report have been updated to incorporate the surveyed locations of the wells. Specifically, the contents of **Appendix A** have been modified to include the surveyed coordinates and elevations for wells URS-05, URS, 06, URS-07, and URS-08. Additionally, the locations of URS-05, URS-06, URS-07, and URS-08 have been adjusted on **Figure 2** and **Figure 3** to the coordinate locations provided by Goff. Lastly, the survey report provided by Goff is included as **Appendix E**. All other content of the report remains unchanged as originally submitted to Arizona Public Service Company.

1.0 Introduction

In 2022 JE Fuller designed and installed a stream flow gaging station for Arizona Public Service (APS) to monitor the water surface elevation of Chaco River within the vicinity of the APS Four Corners Power Plant near Farmington, NM. A single gaging station was installed approximately 7 miles upstream of the Navajo Route 36 bridge spanning the river. **Figure 1** below depicts the location of the new station as well as the location adjacent to the channel of the new pressure transducer sensor.

Maintenance was performed on this equipment in June 2024, and this document summarizes the work performed and highlights a few recommendations.

Figure 1. Station Location.

2.0 Maintenance

2.1. Station Overview

The enclosure for the equipment is positioned above the wash on a high silt bank (**Figure 2**). A pressure transducer was installed to measure the stage in the river. The manufacturer of this sensor is Campbell Scientific, Inc., and the model number is CS451. This is a digital, SDI-12 sensor, and it reports the hydrostatic pressure and temperature. Further, this is a vented transducer, so no correction for atmospheric pressure needs to be made. The translation then from pressure to depth is based upon the unit weight of water.

A field observation camera was also installed. The camera was programmed to take static photos every 12 hours and store them on an on-board SD card. The photographs will provide documentation to aid in the streamflow measurements, as the channel at this location is a natural, non-engineered channel where gaging streamflow at low flows is notoriously difficult. These photographs will especially be useful for establishing time periods of zero flow rate. Photographs are uploaded to the camera manufacturers' cloud-based platform for viewing images, and these settings can be changed by remotely accessing the camera settings.

Figure 2. Field Station on 6/20/2024.

2.2. Maintenance Items

Upon arrival, the station appeared to have no significant damage or issues. The following items were performed during the maintenance task:

Figure 3. Station Solar Panel After Cleaning.

- The station enclosure was unlocked (combination lock code = 5050).
- The solar panel was cleaned.
- The solar charge controller performance was evaluated. No issues were detected. The solar panel voltage was in the expected range.
- All logged data from the data logger was downloaded, and the data logger software was used to identify any faults or anomalous issues, and none were found
- The data logger battery and recently logged voltage data was assessed to evaluate the performance. For instance, the minimum voltage during each night was evaluated, which can indicate a weak or weakening batter.

The battery voltage has remained high throughout each night, indicating a strong battery.

- The cellular modem was accessed to look for any faults, and none were found. The firmware on the modem was updated to the newest available version.
- The SD card for the camera was removed, and all images were downloaded. The internal battery bank of twelve AA batteries were replaced (**Figure 4**). The camera could not access the cellular network, therefore, the mode of the camera was switched to turn the cellular mode off, which enabled the field crew to make time the time lapse settings (every 6 hours) locally, and on-site.
- Pressure transducer maintenance (see discussion below).

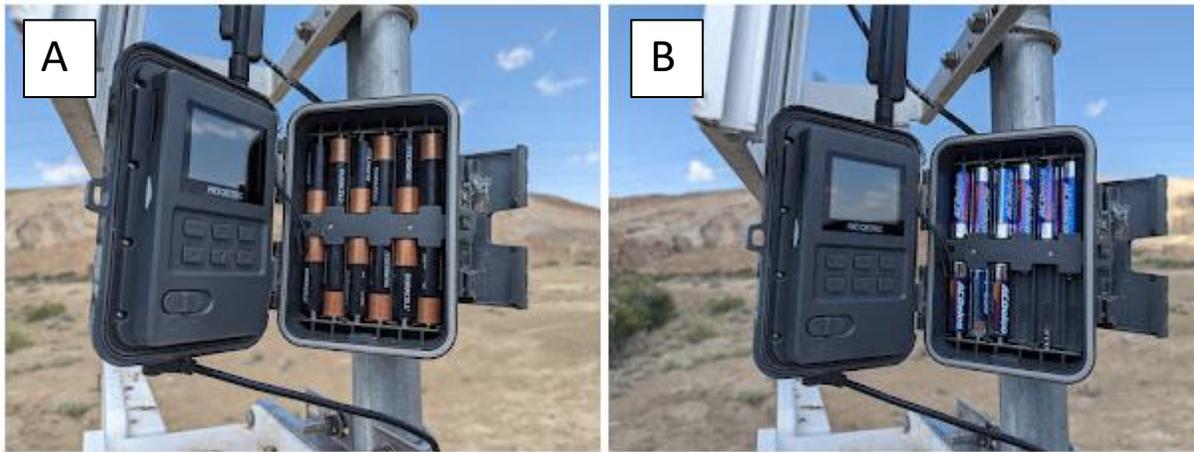

Figure 4. Camera Battery Replacement.

Moving downward to the wash, it was observed that over one foot of sediment deposition has occurred in the channel and on the floodplain surfaces. The subsurface pull box just above the pressure transducer was marked with about 1.25 feet of deposition (**Figure 5**). While access to this box was dug out subsequent flow events that inundate this surface will likely fill this access back in with sediment. This access box is used to access the pressure transducer through the buried conduit, and as it had become submerged with water, sediment then entered into the conduit with the pressure transducer sensor. The result is that the pressure transducer could not be pulled up via this access box.

The conduit housing the actual pressure transducer sensor was also buried approximately 1.5 feet below the wash bottom (**Figure 6** and **Figure 7**). Given that the sensor could not be removed from the conduit due to excessive deposition and impacted sediment in the conduit, a detailed calibration check could not be performed. Instead, the sensor reading was evaluated for a condition where no water was applied to the sensor (i.e., depth = 0.00') and about a foot of depth of water. This was done by filling the excavated hole with water and quickly taking a sensor reading. This limited test was enough to demonstrate that the sensor calibration was reasonably in line with the manufacturer's specifications.

Figure 5. Excavated Access Box.

Figure 6. Pressure Transducer Conduit.

Figure 7. Pressure Transducer Conduit.

3.0 Recommendations

Several key recommendations are made based upon this maintenance work.

- It had been approximately 2.5 years since JE Fuller had last visited this site (during installation). Given the dramatic change in wash configuration it is recommended to perform maintenance on a tighter time interval (e.g., annually).
- As part of this scope of work, cellular data was pre-paid for two years. This interval, however, begins at when the previous cellular data plan expired, which was in October of 2023. That said, the current cellular data plan will expire in October 2025, and it will need to be renewed before then.
- It is recommended during the next maintenance visit to re-work the lower sections of the pressure transducer conduit. Streamflow gaging without any hardened structures to attach equipment or to maintain the grade of the channel (e.g., bedrock, concrete, etc.) is notoriously difficult, and it requires active examination of changing configurations and adapting the sensor position to the new channel configuration. For this case, it is recommended to re-establish the position of the sensor such that it is located at the same elevation of the new wash bottom. Further, the access box will be raised above the existing grade to minimize chances of flow and sediment entering the pressure transducer conduit again.
- After each significant (> 1 foot) flow event in the river it is recommended that APS visit the gaging location and take several photographs.

TECHNICAL EVALUATION OF LABORATORY ANALYTICAL METHOD SPLIT SAMPLING
DATA FOR FLUORIDE COLLECTED FROM FOUR CORNERS AND CHOLLA POWER PLANTS**

**Arizona Public Service Company
Four Corners Power Plant - Fruitland, New Mexico
Cholla Power Plant - Navajo County, Arizona**

INTRODUCTION

This Technical Memorandum (Tech Memo) presents the results of a technical evaluation of groundwater monitoring split sampling data collected from monitoring wells located at the Arizona Public Service Company (APS) Four Corners Power Plant in Fruitland, New Mexico (Four Corners) (**Figure 1**) and at the Cholla Power Plant in Navajo County, Arizona (Cholla) (**Figure 2**) (Sites). WSP USA Environment & Infrastructure Solutions, Inc. (WSP) conducts semi-annual groundwater monitoring at the Sites pursuant to Coal Combustion Residuals (CCR) Rule requirements for groundwater monitoring and corrective action detailed in 40 Code of Federal Regulations Sections 257.90 through 257.98 (CCR Rule) (Federal Register, 2020). The current monitoring network for Four Corners and Cholla are displayed on **Figures 3** and **4**, respectively. The well construction details for monitoring locations included in this evaluation are presented in **Table 1**.

For many years, Eurofins Environment Testing America (Eurofins) has been the contracted laboratory for the semi-annual CCR groundwater monitoring program at the Sites. During the time when Eurofins conducted the CCR groundwater analyses, inconsistencies were noted in the sample dilution factors (DFs) and reporting limits (RLs). These issues ultimately led to an evaluation of alternative laboratories in 2023. The results of the evaluation were presented in

WSP USA Inc.
1230 West Washington Street, Suite 405
Tempe, Arizona 85288-1245

Page 1

wsp.com

the *Technical Evaluation of Laboratory Split Sampling Data Collected from Four Corners and Cholla Power Plants* (WSP, 2023). Eurofins was found to meet all project requirements and CCR compliance samples continued to be submitted to Eurofins for analysis. However, since that evaluation was performed, additional DF and RL inconsistencies were observed in the analysis of fluoride using United States Environmental Protection Agency (USEPA) Drinking Water Method 300.0 during the first semi-annual groundwater monitoring events of 2023 (WSP, 2024a and b). Several RLs were above the designated background threshold values (BTVs) for the designated CCR unit. The laboratory declined to re-analyze the samples at lower dilutions due to elevated sulfate and total dissolved solids (TDS) concentrations, which can adversely affect laboratory equipment. Based on WSP's review sulfate and TDS concentrations in the 2023 first semi-annual monitoring event were consistent with historical data at these locations – except for TDS at MW-11, which was only slightly elevated.

To achieve the lowest level of detection and somewhat mitigate the effect of the higher DFs, fluoride concentrations were estimated between the method detection limit (MDL) and the RL. The reported MDLs ranged from less than (<) 0.8 to < 400 milligrams per liter (mg/L), which for many CCR compliance wells still exceeded the BTV. The analytical fluoride results for the first semi-annual groundwater monitoring events in 2023 for Four Corners and Cholla are presented in **Table 2** and **3**, respectively. Additionally, **Table 2** and **3** include the associated DFs, MDLs, the CCR unit's specified BTVs for fluoride, and the results for sulfate and TDS.

At the suggestion of Eurofins, USEPA Hazardous Waste Test Method 9056A was evaluated as an alternative to USEPA Method 300.0. Each method employs ion chromatography, but USEPA Method 9056A may allow for less sample dilution. A select subset of samples was submitted to Eurofins for fluoride analysis by USEPA Method 300.0 and 9056A during the second semi-annual groundwater monitoring event in 2023 to evaluate the analytical comparability of the methods. The process of selecting the laboratory methods, the selection of the wells to be used in the analysis, and the evaluation and comparison of the results are presented and summarized in the following sections. The Tech Memo evaluates the precision and accuracy of the sampling data and presents recommendations based on the results of the technical evaluation.

SAMPLE COLLECTION AND ANALYSIS

CCR groundwater monitoring program samples for the second semi-annual event in 2023 were collected in November 2023 for Four Corners and October 2023 for Cholla. The split samples were collected from a subset of monitoring wells selected to represent a range of locations near CCR units where fluoride has been consistently detected in the past. At Four Corners; wells were selected because they were downgradient of the Upper Retention Sump (URS) and Multiunit 1. At Cholla, wells were selected at the boundary of the Bottom Ash Pond (BAP) and Fly Ash Pond (FAP) and within the alluvial and Moenkopi formations. The selected monitoring wells are presented in **Table 4**.

A total of 14 and 5 split samples were each collected for Cholla and Four Corners, respectively. Groundwater samples were collected using a low flow sampling method per the project standard operating procedures outlined in the Sampling and Analysis Plans for the Sites (Wood, 2022a and b). Samples were collected in 500 milliliter (mL) unpreserved plastic containers provided by the laboratory for the USEPA Methods 300.0 and 9056 analyses. The holding time for these samples with the associated analyses is 28 days. All semi-annual CCR samples were submitted under a signed chain of custody (CoC) and relinquished to Eurofins for analysis. The collected samples were submitted to Eurofins and analyzed within the specified holding period.

Tables 5 and **6** present the split sampling results for each site. The laboratory reports of analysis are included in **Attachment A**. The reports include the results of CCR groundwater samples that were not evaluated in the split sample analysis.

TECHNICAL EVALUATION RESULTS

ANALYTICAL VALIDATION

A WSP chemist performed a USEPA Stage 2A validation on samples collected. This data evaluation is defined in the project sampling and analysis plan (SAP). Data assessment checklists are generated for each sample delivery group submitted to the analytical laboratory during the reporting period. The laboratory performing the analyses as well as the methods of analysis are presented in the individual data validation checklists completed by the WSP chemist. A WSP chemist reviewed and evaluated all laboratory data and added specific qualifiers based on laboratory deficiencies which are noted in the data validation checklists (**Attachment B**).

No qualifiers were added to the fluoride results evaluated for the Sites. The primary (USEPA Method 300.0) and secondary (USEPA Method 9056) analytical results were reviewed and findings were included in the data validation checklists (**Attachment B**) and in the following section.

All analytical data was deemed useable with no significant deficiencies or rejected records. This determination is based on analyses meeting the SAP-specified holding time of 28-days, the absence of fluoride in the laboratory blank samples, laboratory control sample (LCS)/LCS duplicate recoveries within the specified limits, and matrix spike/matrix spike duplicate (MS/MSD) sample recoveries within the specified limits.

The laboratory performed a duplicate analysis for fluoride on M-46A and MW-77A and results were within the laboratory specified limits. The fluoride analysis RPD for the laboratory matrix spike (MS)/matrix spike duplicate (MSD) samples for M-46A and M-77A were 2 and 3, respectively. These RPDs were both below the laboratory RPD limit of 20.

Additional QA/QC samples (e.g., duplicates and matrix spike/matrix spike duplicates [MS/MSDs]) were collected and used in validating the CCR compliance groundwater samples

that are not included in the laboratory analytical reports in **Attachment A**. A complete set of analytical reports, including all QA/QC samples, are included in the *Annual Groundwater Monitoring and Corrective Action Report 2023* (WSP, 2024a and b). The QA/QC sample evaluation is performed by a qualified chemist and included in the data validation report (WSP, 2024c and d).

METHOD SPLIT PRECISION

Precision, defined as the degree of agreement or reproducibility between analytical results, was evaluated by a WSP chemist and is presented in **Table 7**. Precision is evaluated by comparing the split samples results to the historical ranges for each well and by calculating the relative percent difference (RPD) between the results of the primary and secondary methods. Additionally, the magnitude of sulfate and TDS concentrations relative to historical ranges and BTV benchmarks was assessed as a potential factor contributing to sample dilutions and elevated RLs, particularly in analyses using USEPA Method 300.0.

A WSP chemist evaluated both methods and the relative percent difference (RPD) between the methods during the analytical validation process. The Site specific (Four Corners and Cholla Sites) comparison table includes the relative percent difference (RPD) between analytical methods is presented in **Table 7**. No significant deficiencies or rejected records were present in the data set with the exception of the result for MW-72M (**Table 6**) where the secondary result was two orders of magnitude greater than the BTV for the BAP (less than (<) 80 mg/L versus < 0.8 mg/L) as a result of a separate laboratory dilutions. The findings of the evaluation is presented in the following section per Site.

FOUR CORNERS

Precision between fluoride results from the primary and the secondary results in the Four Corners samples were deemed near equivalent. The dilution factors (DF) for the primary and secondary sample results were two (2) with RLs of 0.8 mg/L. The targeted project specific RL discussed with the laboratory was 0.8 mg/L and both methods were able to achieve the appropriate RL. The RPDs between the primary and secondary fluoride results were 0% excluding the RPD at MW-68 which was 8% (MW-68 fluoride results were 13 and 12 mg/L). The presented RPDs were less than 40%.

Detected concentrations of sulfate and TDS at MW-68 were elevated above the associated BTVs and slightly elevated compared to historically detected concentrations. The detected concentrations of sulfate and TDS at the remaining locations were consistent with historically detected concentrations. The laboratory was able to achieve the appropriate RLs for fluoride with the elevated sulfate and TDS concentrations at MW-68.

The primary and secondary sample results were consistent with historically detected concentrations. The sample results had acceptable RLs and DFs per the project's specifications.

CHOLLA

Precision between fluoride results from the primary and the secondary results were deemed generally acceptable, with RPDs less than 40%, differences between detected concentrations less than the average reporting limit, or differences between a non-detect results and a low detection (MW-77A) with the following exception (**Table 7**):

- ▶ The non-detect fluoride result observed at MW-72M. The RPD between the primary and secondary sample results were 196% due to a RL of 80 mg/L and a DF of 200 for the secondary sample result. The 300.0 and 9056 analyses were performed at 2 times and 200 times dilutions and fluoride was not detected in either analysis.

The primary fluoride sample results were consistent with historically detected concentrations excluding the non-detect secondary result at MW-72M which was above the Bottom Ash Pond (BAP) BTV of 0.8 mg/L. Precision values between results from the primary and the secondary analytical results were deemed near equivalent excluding results at MW-72M.

The DFs for the primary and secondary sample results were 2 with RLs of 0.8 mg/L excluding the following:

- ▶ MW-72M
 - Primary: DF of 2 and RL of 0.8 mg/L
 - Secondary: DF of 200 and RL of 80 mg/L
- ▶ MW-77A
 - Primary: DF of 2 and RL of 0.8 mg/L
 - Secondary: DF of 1 and RL of 0.4 mg/L
- ▶ MW-78A
 - Primary: DF of 1 and RL of 0.4 mg/L
 - Secondary: DF of 1 and RL of 0.4 mg/L
- ▶ W-306
 - Primary: DF of 2 and RL of 0.8 mg/L
 - Secondary: DF of 1 and RL of 0.4 mg/L

The targeted project specific RL discussed with the laboratory was 0.8 mg/L and both methods were able to achieve the RL excluding the secondary fluoride result at MW-72M. One primary and 3 secondary sample results were able to be analyzed with a single dilution achieving a lower RL of 0.4 mg/L at MW-77A, MW-78A, and W-306. Additionally, a matrix spike (MS) of fluoride was performed by the laboratory on MW-77A and the MS recoveries were within the laboratory specified limits.

The detected concentrations of sulfate and TDS at the locations included in the evaluation were consistent with historically detected concentrations. The laboratory was able to achieve the appropriate RLs for fluoride with the detected sulfate and TDS concentrations. Based on this, the high DFs and elevated RLs in the April 2023 monitoring event can be concluded to have been the result of an analyst over dilution.

The primary and secondary sample results were consistent with historically detected concentrations. The sample results had acceptable RLs and DFs per the project's specifications excluding fluoride results at MW-72M. The primary results were used for all analyses performed for the CCR monitoring evaluations and the secondary sample results were deemed generally useable for comparison purposes excluding fluoride results at MW-72M.

RECOMMENDATIONS

Based on the analytical data evaluation of groundwater samples collected during the second semi-annual CCR groundwater monitoring event in 2023, there were no records that were rejected during data validation, but imprecision between analytical results was observed at MW-72M. An over dilution was performed on the sample MW-72M, which is attributed to an analyst error. The performed dilution is at the discretion of the analyst and subject to performance errors

No significant discrepancies were noted between the results of the primary and secondary analytical analyses. Data was deemed generally comparable from primary to secondary analyses. The lowest RL of 0.4 mg/L was achieved with one and three collected samples using USEPA Method 300.0 and US Method 9056A, respectively. These reporting limits were obtained with a one times dilution factor. However, the US Method 9056A could not consistently achieve the lower reporting limit for the fluoride analysis. Reporting limits were achieved for the analysis of TDS and sulfate at similar and/or higher concentrations than historical ranges, and therefore the April 2023 high DFs are concluded to have been the result of analyst over dilution.

Based on the results of the evaluation; it is recommended for the CCR groundwater monitoring samples to continue to be submitted to Eurofins and request the USEPA Method 300.0 for analysis. The chosen method met all project requirements, and the laboratory is aware of required RLs and project specific BTVs. The selected analytical method will reduce the occurrence of variations as the CCR groundwater monitoring program continues and maintain overall program consistency. Additionally, it is recommended to continue monitoring for performance errors, like dilution errors and, if errors continue, to consider changing the contracted laboratory in order to maintain compliance.

Notes and Abbreviations:

BTV - Background Threshold Value

CCR - Coal Combustion Residual

CWTP - Combined Waste Treatment Pond

DFADA - Dry Fly Ash Disposal Area

ID - Identification

mg/L - Milligrams per Liter

MDL - method detection limit

Method Detection Limit exceeded the associated BTV

¹ - Sample analyzed by USEPA Method 300.0

² - Sample analyzed by US Method SM 2540C

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

ANALYTICAL REPORT

PREPARED FOR

Attn: Natalie Chrisman
Arizona Public Service Company
PO BOX 188, Ste. 4458
Joseph City, Arizona 86032

Generated 11/14/2023 2:13:10 PM Revision 1

JOB DESCRIPTION

CCR Groundwater Monitoring
APS Cholla Power Plant (FAP)

JOB NUMBER

550-209471-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Authorization

Authorized for release by
Linda Eshelman, Project Manager II

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|---|
| D1 | Sample required dilution due to matrix. |
| D2 | Sample required dilution due to high concentration of analyte. |
| D5 | Minimum Reporting Limit (MRL) adjusted due to sample dilution; analyte was non-detect in the sample. |
| E2 | Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| L3 | The associated blank spike recovery was above method acceptance limits. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|---|
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| M1 | Matrix spike recovery was high, the associated blank spike recovery was acceptable. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |

Narrative

**Job Narrative
550-209471-1**

REVISION

The report being provided is a revision of the original report sent on 11/10/2023. The report (revision 1) is being revised due to Final report was sent out with duplicate 200.8 metals.

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 10/20/2023 3:01 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 1.9°C, 2.1°C, 2.3°C, 3.1°C, 3.2°C and 4.6°C

HPLC/IC

Method 300_ORGFMS: The following samples were diluted due to the nature of the sample matrix: CH-CCR-M43A-1023 (550-209471-1), CH-CCR-M45A-1023 (550-209471-3), CH-CCR-W125-1023 (550-209471-16) and CH-CCR-BudHunt-1023 (550-209471-19). Elevated reporting limits (RLs) are provided. The following samples contain an analyte not part of the method profile which interferes with fluoride providing an indiscernible chromatogram. A 2x dilution is required.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 200.8_CWA_LL: The laboratory control sample (LCS) associated with preparation batch 550-309754 and analytical batch 550-309936 was outside acceptance criteria for Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. CH-CCR-M43A-1023 (550-209471-1), CH-CCR-M45A-1023 (550-209471-3), CH-CCR-M46A-1023 (550-209471-4), CH-CCR-M50A-1023 (550-209471-6), CH-CCR-M51A-1023 (550-209471-8), CH-CCR-M65A-1023 (550-209471-10), CH-CCR-M66A-1023 (550-209471-12), CH-CCR-M67A-1023 (550-209471-14), CH-CCR-W125-1023 (550-209471-16), CH-CCR-W-126R-1023 (550-209471-17) and CH-CCR-BudHunt-1023 (550-209471-19)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Accreditation/Certification Summary

Client: Arizona Public Service Company
Project/Site: CCR Groundwater Monitoring

Job ID: 550-209471-1
SDG: APS Cholla Power Plant (FAP)

Laboratory: Eurofins Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|-----------|---------|-----------------------|-----------------|
| Arizona | State | AZ0728 | 06-10-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|-----------------|-------------|--------|-------------|
| 200.8 LL | 200.8 | Water | Molybdenum |
| SM 4500 H+ B | | Water | Temperature |

Laboratory: Eurofins Calscience

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

| Authority | Program | Identification Number | Expiration Date |
|------------|---------------------|-----------------------|-----------------|
| Arizona | State | AZ0830 | 11-16-23 |
| California | SCAQMD LAP | 17LA0919 | 11-30-23 |
| California | State | 3082 | 07-31-24 |

ANALYTICAL REPORT

PREPARED FOR

Attn: Natalie Chrisman
Arizona Public Service Company
PO BOX 188, Ste. 4458
Joseph City, Arizona 86032

Generated 11/14/2023 9:19:18 AM

JOB DESCRIPTION

CCR Groundwater Monitoring
APS Cholla Power Plant (BAP)

JOB NUMBER

550-209476-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|---|
| D1 | Sample required dilution due to matrix. |
| D2 | Sample required dilution due to high concentration of analyte. |
| D5 | Minimum Reporting Limit (MRL) adjusted due to sample dilution; analyte was non-detect in the sample. |
| E2 | Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix. |
| M1 | Matrix spike recovery was high, the associated blank spike recovery was acceptable. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| L3 | The associated blank spike recovery was above method acceptance limits. |
| M1 | Matrix spike recovery was high, the associated blank spike recovery was acceptable. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |
| V1 | CCV recovery was above method acceptance limits. This target analyte was not detected in the sample. |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|---|
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| M2 | Matrix spike recovery was low, the associated blank spike recovery was acceptable. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |

Job ID: 550-209476-1
SDG: APS Cholla Power Plant (BAP)

Job ID: 550-209476-1

Laboratory: Eurofins Phoenix

Narrative

Job Narrative 550-209476-1

Receipt

The samples were received on 10/20/2023 3:01 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 1.9° C, 2.1° C, 2.3° C, 3.1° C, 3.2° C and 4.6° C.

HPLC/IC

Method 300.0: The following sample was diluted due to the nature of the sample matrix: CH-CCR-MW72M-1023 (550-209476-9). Elevated reporting limits (RLs) are provided. The following samples contain an analyte not part of the method profile which interferes with fluoride providing an indiscernible chromatogram. A 2x dilution is required.

Method 300.0: Due to the high concentration of chloride and sulfate, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 550-309930 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 300.0: Due to the high concentration of chloride and sulfate, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 550-309960 could not be evaluated for accuracy and precision of those analytes. The associated laboratory control sample (LCS) met acceptance criteria.

Methods 300.0, 9056A: The following samples were analyzed outside of analytical holding time due to analyst scheduling errors: (550-209060-O-1) and (550-209060-O-1 ^10)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 200.8 LL: The laboratory control sample (LCS) associated with preparation batch 550-309752 and analytical batch 550-309934 was outside acceptance criteria for the analyte Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. CH-CCR-W306-1023 (550-209476-21) and CH-CCR-W314-1023 (550-209476-23)

Method 200.8 LL: The laboratory control sample (LCS) associated with preparation batch 550-309755 and analytical batch 550-309935 was outside acceptance criteria for the analyte Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. CH-CCR-M53A-1023 (550-209476-1), CH-CCR-MW69A-1023 (550-209476-3), CH-CCR-MW70M-1023 (550-209476-5), CH-CCR-MW71A-1023 (550-209476-7), CH-CCR-MW72M-1023 (550-209476-9), CH-CCR-MW73A-1023 (550-209476-11), CH-CCR-MW74M-1023 (550-209476-13), CH-CCR-MW77A-1023 (550-209476-15), CH-CCR-W301-1023 (550-209476-17) and CH-CCR-W303-1023 (550-209476-19)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry

Method SM 2540C: Constant weight was not achieved after 3 drying cycles for the following sample: CH-CCR-MW72M-1023 (550-209476-9).

Method SM 5310B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 550-310867 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Sample Summary

| Question | Answer | Comment |
|--|--------|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | True | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | False | Check done at department level as required. |

JOB DESCRIPTION

CCR Groundwater Monitoring
APS Cholla Power Plant (BAP)

JOB NUMBER

550-209609-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|--|
| D2 | Sample required dilution due to high concentration of analyte. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| B1 | Target analyte detected in method blank at or above the method reporting limit. |
| M2 | Matrix spike recovery was low, the associated blank spike recovery was acceptable. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|---|
| D2 | Sample required dilution due to high concentration of analyte. |
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| M2 | Matrix spike recovery was low, the associated blank spike recovery was acceptable. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

Job ID: 550-209609-1

Laboratory: Eurofins Phoenix

Narrative

Job Narrative 550-209609-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 10/25/2023 1:44 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 1.1°C, 1.4°C, 1.6°C and 3.2°C

HPLC/IC

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 200.8_CWA_LL: Due to sample matrix effect on the internal standard (ISTD), a dilution was required for the following samples: CH-CCR-MW78A-1023 (550-209609-1), CH-CCR-MW78A-1023 (550-209609-2), CH-CCR-BAPTD-1023 (550-209609-3), CH-CCR-BAPTD-1023 (550-209609-4), CH-CCR-Petroglyph-1023 (550-209609-5), CH-CCR-Petroglyph-1023 (550-209609-6), CH-CCR-TannerWash-1023 (550-209609-7), CH-CCR-TannerWash-1023 (550-209609-8), CH-CCR-TWX3-1023 (550-209609-9), CH-CCR-TWX3-1023 (550-209609-10), (550-209609-F-1-A MS) and (550-209609-F-1-B MSD).

Method 200.8_CWA_LL: Due to sample matrix effect on the internal standard (ISTD), a dilution was required for the following samples: CH-CCR-MW78A-1023 (550-209609-1), CH-CCR-TWX5-1023 (550-209609-11), CH-CCR-TWX5-1023 (550-209609-12), CH-CCR-TWX7-1023 (550-209609-13), CH-CCR-TWX7-1023 (550-209609-14), CH-CCR-TWX9-1023 (550-209609-15), CH-CCR-TWX9-1023 (550-209609-16), CH-CCR-TWX10-1023 (550-209609-17), CH-CCR-TWX10-1023 (550-209609-18), CH-CCR-EB01-1023 (550-209609-19), CH-CCR-EB01-1023 (550-209609-20), (550-209609-F-1-A MS ^5) and (550-209609-F-1-B MSD ^5).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method SM5310_DOC_B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 550-310867 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Accreditation/Certification Summary

Client: Arizona Public Service Company
 Project/Site: CCR Groundwater Monitoring

Job ID: 550-209609-1
 SDG: APS Cholla Power Plant (BAP)

Laboratory: Eurofins Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|-----------|---------|-----------------------|-----------------|
| Arizona | State | AZ0728 | 06-10-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|-----------------|-------------|--------|-------------|
| 200.8 LL | 200.8 | Water | Molybdenum |
| SM 4500 H+ B | | Water | Temperature |

Laboratory: Eurofins Calscience

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

| Authority | Program | Identification Number | Expiration Date |
|------------|---------------------|-----------------------|-----------------|
| Arizona | State | AZ0830 | 11-16-23 |
| California | SCAQMD LAP | 17LA0919 | 11-30-23 |
| California | State | 3082 | 07-31-24 |
| Nevada | State | CA00111 | 07-31-24 |
| Oregon | NELAP | 4175 | 02-02-24 |
| USDA | US Federal Programs | P330-22-00059 | 06-08-26 |
| Washington | State | C916-18 | 10-11-23 * |

Laboratory: Eurofins Denver

The accreditations/certifications listed below are applicable to this report.

| Authority | Program | Identification Number | Expiration Date |
|-----------|---------|-----------------------|-----------------|
| Arizona | State | AZ0713 | 12-20-23 |

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4= HNO3; 5= NaOH; 6= Other
 Possible Hazard Identification:
 Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.
 Non-Hazard Flammable Skin Irritant Poison B Unknown
 Return to Client Disposal by Lab Archive for _____ Months
 Special Instructions/QC Requirements & Comments:
 Perform Method 200.8 with collision cell; * As marked on the bottle; perform dissolved analyses with sample provided in bottles marked 'field filtered'
 Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southwest, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/test/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southwest, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southwest, LLC.

JOB DESCRIPTION

CCR Groundwater Monitoring

JOB NUMBER

550-210429-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Authorization

Authorized for release by
Linda Eshelman, Project Manager II
linda.eshelman@et.eurofinsus.com
(602)659-7681

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|---|
| D2 | Sample required dilution due to high concentration of analyte. |
| E2 | Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix. |
| M2 | Matrix spike recovery was low, the associated blank spike recovery was acceptable. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| R4 | MS/MSD RPD exceeded the method control limit. Recovery met acceptance criteria. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|---|
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Case Narrative

Client: Arizona Public Service Company
Project: CCR Groundwater Monitoring

Job ID: 550-210429-1

Job ID: 550-210429-1

Eurofins Phoenix

Job Narrative 550-210429-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 11/10/2023 2:28 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.8°C and 2.4°C

HPLC/IC

Method 300_ORGFMS: Spike compounds were inadvertently omitted during the extraction process for the matrix spike (MS); therefore, matrix spike recoveries are unavailable for analytical batch 550-311323. The associated laboratory control sample (LCS) met acceptance criteria.

Method 300_ORGFMS: The matrix spike / matrix spike duplicate (MS/MSD) precision for analytical batch 550-311323 was outside control limits. Spike omitted from matrix spike (MS). Laboratory control sample duplicate (LCS/LCSD) precision was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 200.8_CWA_LL: The laboratory control sample (LCS) associated with preparation batch 550-311057 and analytical batch 550-311226 was outside acceptance criteria for the analytes Barium and Lead. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. FC-CCR-MW52-1123 (550-210429-1), FC-CCR-MW61-1123 (550-210429-2) and FC-CCR-MW75-1123 (550-210429-3)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Revision

The report being provided is a revision of the original report sent on 12/11/2023. The report (revision 1) is being revised due to: Client questioned the 9056 result, upon review, it was found that the dilution factor was entered incorrect..

Accreditation/Certification Summary

Client: Arizona Public Service Company
Project/Site: CCR Groundwater Monitoring

Job ID: 550-210429-1

Laboratory: Eurofins Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|-----------|---------|-----------------------|-----------------|
| Arizona | State | AZ0728 | 06-10-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|-----------------|-------------|--------|-------------|
| 200.8 LL | 200.8 | Water | Molybdenum |
| SM 4500 H+ B | | Water | Temperature |

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|-----------|---------|-----------------------|-----------------|
| Arizona | State | AZ0830 | 11-16-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|-----------------|-------------|--------|---------|
| 200.7 Rev 4.4 | 200.7 | Water | Lithium |

Login Sample Receipt Checklist

Client: Arizona Public Service Company

Job Number: 550-210429-1

Login Number: 210429

List Number: 1

Creator: Maycock, Lisa

List Source: Eurofins Phoenix

| Question | Answer | Comment |
|--|--------|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | True | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | False | Check done at department level as required. |

JOB DESCRIPTION

CCR Groundwater Monitoring
APS Four Corners Power Plant (URS)

JOB NUMBER

550-210593-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Authorization

Authorized for release by
Linda Eshelman, Project Manager II

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|--|
| D2 | Sample required dilution due to high concentration of analyte. |
| M2 | Matrix spike recovery was low, the associated blank spike recovery was acceptable. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| L3 | The associated blank spike recovery was above method acceptance limits. |
| L4 | The associated blank spike recovery was below method acceptance limits. |
| L5 | The associated blank spike recovery was above laboratory/method acceptance limits. This analyte was not detected in the sample. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |
| V1 | CCV recovery was above method acceptance limits. This target analyte was not detected in the sample. |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|---|
| D1 | Sample required dilution due to matrix. |
| H1 | Sample analysis performed past holding time. |
| H2 | Initial analysis within holding time. Reanalysis for the required dilution was past holding time. |
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |

Case Narrative

Client: Arizona Public Service Company
Project: CCR Groundwater Monitoring

Job ID: 550-210593-1

Job ID: 550-210593-1

Eurofins Phoenix

Job Narrative 550-210593-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 11/15/2023 2:43 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.1°C

HPLC/IC

Method 300_ORGFMS: Spike compounds were inadvertently omitted during the extraction process for the matrix spike/matrix spike duplicate (MS/MSD); therefore, matrix spike recoveries are unavailable for analytical batch 550-311405. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 200.8_CWA_LL: Samples were diluted 10x due to matrix

FC-CCR-MW67-1123 (550-210593-1), FC-CCR-MW68-1123 (550-210593-2), FC-CCR-MW69-1123 (550-210593-3), FC-CCR-MW83-1123 (550-210593-4), FC-CCR-MW84-1123 (550-210593-5), FC-CCR-MW85-1123 (550-210593-6), FC-CCR-FD01-1123 (550-210593-7), FC-CCR-CM01-1123 (550-210593-8), FC-CCR-CM02-1123 (550-210593-9), (550-210594-B-12-C), (550-210594-B-12-A MS) and (550-210594-B-12-B MSD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method 2540C_Calcd: The following sample was analyzed outside of analytical holding time due to residue being >0.2000 g at 10 mL: FC-CCR-MW67-1123 (550-210593-1).

Method 2540C_Calcd: Reanalysis of the following sample was performed outside of the analytical holding time due to noticeable errors in the bag weights from batch 311341 : FC-CCR-MW84-1123 (550-210593-5).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Revision

The report being provided is a revision of the original report sent on 12/6/2023. The report (revision 1) is being revised due to: Client questioned the 9056 result, upon review, it was found that the dilution factor was entered incorrect..

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Cholla CCR Data Review

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Sample Receipt Condition:

COC Signed and Complete?

Yes No

If No, provide details.

Sample Login Matched COC?

Yes No

If no, provide details.

The sample ID for sample CH-CCR-M45A-1023 was incorrectly logged by the laboratory as CH-CCR-M452-1023. For the remainder of this report, WSP refers to this sample as CH-CCR-M45A-1023.

Sample receipt temperature $\leq 6^{\circ}\text{C}$?

Yes No N/A

If no, provide details.

Other sample receipt issues?

Yes No

If yes, provide details.

Cholla CCR Data Review

1. Samples analyzed for metals and radionuclides within 180 days of sampling?

Yes No N/A

2. Samples analyzed for mercury, ammonia, chloride, fluoride, nitrate/nitrite, sulfate, TOC, and/or DOC within 28 days of sampling?

Yes No N/A

3. Samples Analyzed for alkalinity within 14 days of sampling?

Yes No N/A

4. Samples analyzed for total dissolved solids (TDS) within 7 days of sampling?

Yes No N/A

5. Samples analyzed for pH within 15 minutes of sampling?

Yes No N/A

If No:

| Sample ID | Analysis | Time Between Collection and Analysis | Effect on Data Usability |
|---------------------|----------|--------------------------------------|--------------------------|
| CH-CCR-M43A-1023 | pH | 9 days, 16 hours, 51 minutes | J-HT |
| CH-CCR-M45A-1023 | pH | 8 days, 19 hours, 38 minutes | J-HT |
| CH-CCR-M46A-1023 | pH | 9 days, 19 hours, 56 minutes | J-HT |
| CH-CCR-M50A-1023 | pH | 8 days, 22 hours, 58 minutes | J-HT |
| CH-CCR-M51A-1023 | pH | 8 days, 23 hours, 43 minutes | J-HT |
| CH-CCR-M65A-1023 | pH | 9 days, 22 hours, 2 minutes | J-HT |
| CH-CCR-M66A-1023 | pH | 9 days, 23 hours, 7 minutes | J-HT |
| CH-CCR-M67A-1023 | pH | 9 days, 18 hours, 8 minutes | J-HT |
| CH-CCR-W125-1023 | pH | 8 days, 22 hours, 9 minutes | J-HT |
| CH-CCR-W126R-1023 | pH | 9 days, 23 hours, 57 minutes | J-HT |
| CH-CCR-BudHunt-1023 | pH | 9 days, 0 hours, 47 minutes | J-HT |

Note:

HT = Holding time exceeded.

6. Target analytes detected in the blanks?

Yes No N/A

If Yes:

| Detected Analyte | Concentration | Samples with concentrations less than 5 times the blank detection | Effect on Data Usability |
|------------------|---------------|---|--------------------------|
| | | | |

Cholla CCR Data Review

7. LCS recoveries within laboratory-specified limits?

Yes **No** N/A

If No:

| Analyte | Recovery | QC Limits | Affected Samples | Effect on Data Usability |
|---------|------------|-----------|---|--------------------------|
| Barium | 125%, 119% | 85-115% | CH-CCR-M43A-1023, CH-CCR-M45A-1023, CH-CCR-M46A-1023, CH-CCR-M50A-1023, CH-CCR-M51A-1023, CH-CCR-M65A-1023, CH-CCR-M66A-1023, CH-CCR-M67A-1023, CH-CCR-W125-1023, CH-CCR-W-126R-1023, CH-CCR-BudHunt-1023 | J-HL |

Note:

HL = High laboratory control sample recovery. Result may be biased high.

8. MS performed on a project-specific sample?

Yes No N/A

If Yes:

| Spiked Sample ID | Spiked Analyte(s) |
|--------------------|--|
| CH-CCR-M43A-1023 | Ammonia, Beryllium, Boron, Calcium, Iron, Magnesium, Manganese, Nitrate/nitrite, Potassium, Sodium |
| CH-CCR-M45A-1023 | Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Selenium, Thallium |
| CH-CCR-M46A-1023 | Chloride, Fluoride, Sulfate |
| CH-CCR-M51A-1023 | Lithium |
| CH-CCR-M66A-1023 | DOC |
| CH-CCR-W-126R-1023 | Mercury |

Cholla CCR Data Review

a. Are MS recoveries and/or precision within laboratory-specified limits?

Yes No N/A

If No:

| Sample ID | Analyte | RPD or Recovery | Accuracy or Recovery Limits | Effect on Data Usability |
|------------------|-----------|-----------------|-----------------------------|--------------------------|
| CH-CCR-M43A-1023 | Calcium | -7%, 65% | 70-130% | NA4 |
| CH-CCR-M43A-1023 | Magnesium | 61%, MS | 70-130% | NA4 |
| CH-CCR-M43A-1023 | Sodium | -219%, -65% | 70-130% | NA4 |
| CH-CCR-M46A-1023 | Chloride | 9%, -5% | 80-120% | NA4 |
| CH-CCR-M46A-1023 | Sulfate | 29%, 11% | 80-120% | NA4 |

Note:

NA4 = The concentration detected in the unspiked native sample is more than four times the spike concentration and it is not possible to assess data usability based on the MS recovery.

9. Field duplicate collected?

Yes No

If Yes:

| Parent Sample | Field Duplicate |
|---------------|-----------------|
| | |

a. Are RPDs between primary and duplicate results $\leq 20\%$ or are differences between analyte concentrations \leq the reporting limit?

Yes No N/A

If No:

| Primary Sample ID | Duplicate Sample ID | Analyte | RPD | Effect on Data Usability |
|-------------------|---------------------|---------|-----|--------------------------|
| | | | | |

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes No N/A

If Yes:

| Sample ID | Analysis |
|------------------|----------------------------------|
| CH-CCR-M46A-1023 | Chloride, Fluoride, Sulfate, TDS |
| CH-CCR-M45A-1023 | pH |

| CH-CCR-MW78A-1023 | Ammonia, Antimony, Arsenic, Barium, Cadmium, Chromium, Cobalt, Lead, Molybdenum, Selenium, Thallium |
| CH-CCR-TWX10-1023 | Nitrate/Nitrite |

a. Are MS recoveries and/or precision within laboratory-specified limits?

Yes No N/A

If No:

| Sample ID | Analyte | RPD or Recovery | Accuracy or Recovery Limits | Effect on Data Usability |
|-------------------|------------|-----------------|-----------------------------|--------------------------|
| CH-CCR-MW78A-1023 | Antimony | 18%, 19% | 70-130% | UJ-LM |
| CH-CCR-MW78A-1023 | Arsenic | 18%, 19% | 70-130% | J-LM |
| CH-CCR-MW78A-1023 | Barium | 19%, 20% | 70-130% | J-LM |
| CH-CCR-MW78A-1023 | Cadmium | 18%, 18% | 70-130% | UJ-LM |
| CH-CCR-MW78A-1023 | Chromium | 17%, 18% | 70-130% | UJ-LM |
| CH-CCR-MW78A-1023 | Cobalt | 17%, 18% | 70-130% | UJ-LM |
| CH-CCR-MW78A-1023 | Lead | 18%, 19% | 70-130% | UJ-LM |
| CH-CCR-MW78A-1023 | Molybdenum | 19%, 20% | 70-130% | J-LM |
| CH-CCR-MW78A-1023 | Selenium | 17%, 17% | 70-130% | J-LM |
| CH-CCR-MW78A-1023 | Thallium | 17%, 18% | 70-130% | UJ-LM |
| CH-CCR-BAPTD-1023 | Calcium | -97%, -83% | 70-130% | NA4 |
| CH-CCR-BAPTD-1023 | Magnesium | 29%, 34% | 70-130% | NA4 |
| CH-CCR-BAPTD-1023 | Sodium | -450%, -410% | 70-130% | NA4 |

Note:

LM = Low matrix spike recovery.

NA4 = The concentration detected in the unspiked native sample is more than four times the spike concentration and it is not possible to assess data usability based on the MS recovery.

Cholla CCR Data Review

9. Field duplicate collected?

Yes No

If Yes:

| Parent Sample | Field Duplicate |
|---------------|-----------------|
| | |

a. Are RPDs between primary and duplicate results $\leq 20\%$ or are differences between analyte concentrations \leq the reporting limit?

Yes No N/A

If No:

| Primary Sample ID | Duplicate Sample ID | Analyte | RPD | Effect on Data Usability |
|-------------------|---------------------|---------|-----|--------------------------|
| | | | | |

10. Did the laboratory perform duplicate analyses on project-specific samples?

Yes No N/A

If Yes:

| Sample ID | Analysis |
|-------------------|---------------------|
| CH-CCR-MW78A-1023 | Alkalinity, pH, TDS |

a. Is the RPD between duplicate results within laboratory-specified limits or is the difference between analyte concentrations less than the reporting limit?

Yes No N/A

If No:

| Sample ID | Analyte | Effect on Data Usability |
|-----------|---------|--------------------------|
| | | |

11. Are total concentrations greater than dissolved concentrations or do total and dissolved results meet criteria for duplicate analyses?

Yes No N/A

If No:

| Sample ID | Analyte | Total Concentration (mg/L) | Dissolved Concentration (mg/L) | Effect on Data Usability |
|-----------|---------|----------------------------|--------------------------------|--------------------------|
| | | | | |

| Total Dissolved Solids (TDS) | General Chemistry | SM 2540C |
| pH | General Chemistry | SM 4500 H+B |

Qualifier Definitions:

- J** The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- U** The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- UJ** The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

JOB DESCRIPTION

CCR Groudwater Monitoring
APS Four Corners Power Plant (Multiunit)

JOB NUMBER

550-218672-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|---|
| D2 | Sample required dilution due to high concentration of analyte. |
| E2 | Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| B1 | Target analyte detected in method blank at or above the method reporting limit. |
| L4 | The associated blank spike recovery was below method acceptance limits. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|---|
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Case Narrative

Client: Arizona Public Service Company
Project: CCR Groundwater Monitoring

Job ID: 550-218672-1

Job ID: 550-218672-1

Eurofins Phoenix

Job Narrative 550-218672-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 5/21/2024 2:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.4°C.

HPLC/IC

Method 300_ORGFMS: Due to the high concentration of Chloride, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 550-321493 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 200.7 - Total Recoverable: The instrument blank for analytical batch 280-655224 contained Li greater than one-half the reporting limit (RL), and were not re-analyzed because the affected samples contained >10x the amount found in the CCB. The data have been qualified and reported.

Method 200.7_CWA: The continuing calibration blank (CCB) for analytical batch 550-321751 contained Sodium above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed. FC-CCR-MW52-0524 (550-218672-1), FC-CCR-MW61-0524 (550-218672-2) and FC-CCR-MW75-0524 (550-218672-3)

Method 200.8_CWA_LL: The laboratory control sample (LCS) associated with preparation batch 550-321480 and analytical batch 550-321685 was outside acceptance criteria for the analyte Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. FC-CCR-MW52-0524 (550-218672-1), FC-CCR-MW61-0524 (550-218672-2) and FC-CCR-MW75-0524 (550-218672-3)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Eurofins Phoenix

| Question | Answer | Comment |
|---|--------|---|
| Radioactivity wasn't checked or is \leq background as measured by a survey meter. | True | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | False | Check done at department level as required. |

ANALYTICAL REPORT

PREPARED FOR

Attn: Natalie Chrisman
Arizona Public Service Company
PO BOX 188, Ste. 4458
Joseph City, Arizona 86032

Generated 6/5/2024 4:37:11 PM

JOB DESCRIPTION

CCR Groundwater Monitoring
APS Four Corners Power Plant (URS)

JOB NUMBER

550-218673-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|---|
| D2 | Sample required dilution due to high concentration of analyte. |
| E2 | Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| L4 | The associated blank spike recovery was below method acceptance limits. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|---|
| E2 | Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix. |
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Case Narrative

Client: Arizona Public Service Company
Project: CCR Groundwater Monitoring

Job ID: 550-218673-1

Job ID: 550-218673-1

Eurofins Phoenix

Job Narrative 550-218673-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 5/21/2024 2:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.1°C and 1.9°C.

HPLC/IC

Method 300_ORGFMS: Due to the high concentration of Chloride, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 550-321493 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 200.7 - Total Recoverable: The instrument blank for analytical batch 280-655224 contained Li greater than one-half the reporting limit (RL), and were not re-analyzed because the affected samples contained >10x the amount found in the CCB. The data have been qualified and reported.

Method 200.8_CWA_LL: The laboratory control sample (LCS) associated with preparation batch 550-321481 and analytical batch 550-321684 was outside acceptance criteria for the analyte Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. FC-CCR-MW84-0524 (550-218673-8), FC-CCR-MW85-0524 (550-218673-9), FC-CCR-FD01-0524 (550-218673-10), FC-CCR-CM01-0524 (550-218673-11), FC-CCR-CM02-0524 (550-218673-12), FC-CCR-URS05-0524 (550-218673-13), FC-CCR-URS06-0524 (550-218673-14), FC-CCR-URS07-0524 (550-218673-15), FC-CCR-URS08-0524 (550-218673-16) and FC-CCR-FD02-0524 (550-218673-17)

Method 200.8_CWA_LL: The laboratory control sample (LCS) associated with preparation batch 550-321480 and analytical batch 550-321685 was outside acceptance criteria for the analyte Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. FC-CCR-MW67-0524 (550-218673-1), FC-CCR-MW68-0524 (550-218673-2), FC-CCR-MW69-0524 (550-218673-3), FC-CCR-MW71-0524 (550-218673-4), FC-CCR-MW72-0524 (550-218673-5), FC-CCR-MW73-0524 (550-218673-6) and FC-CCR-MW83-0524 (550-218673-7)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method 2540C_Calcd: The analysis volume selected for the following samples produced a base result greater than 200mg before calculation of the final result: FC-CCR-MW67-0524 (550-218673-1) and FC-CCR-MW68-0524 (550-218673-2). Reanalysis could not be performed due to holding time exceedance. The reference method specifies that no more than 200mg of weight be recovered for a chosen sample analysis volume in order to produce the best data precision. As such, these data have been qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Accreditation/Certification Summary

Client: Arizona Public Service Company
Project/Site: CCR Groundwater Monitoring

Job ID: 550-218673-1
SDG: APS Four Corners Power Plant (URS)

Laboratory: Eurofins Phoenix

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|-----------|---------|-----------------------|-----------------|
| Arizona | State | AZ0728 | 06-09-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|-----------------|-------------|--------|-------------|
| 200.8 LL | 200.8 | Water | Molybdenum |
| SM 4500 H+ B | | Water | Temperature |

Laboratory: Eurofins Denver

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|-----------|---------|-----------------------|-----------------|
| Arizona | State | AZ0713 | 12-20-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|-----------------|-------------|--------|---------|
| 200.7 Rev 4.4 | 200.7 | Water | Lithium |

| Question | Answer | Comment |
|--|--------|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | True | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | False | Check done at department level as required. |

JOB DESCRIPTION

CCR Groundwater Monitoring
APS - Four Corners Power Plant (Other)

JOB NUMBER

550-218680-1

Eurofins Phoenix

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|--|
| D2 | Sample required dilution due to high concentration of analyte. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| L4 | The associated blank spike recovery was below method acceptance limits. |
| M3 | The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to the spike level. The associated blank spike was acceptable. |
| T5 | Laboratory not licensed for this parameter |

General Chemistry

| Qualifier | Qualifier Description |
|-----------|--|
| B1 | Target analyte detected in method blank at or above the method reporting limit. |
| B7 | Target analyte detected in method blank at or above method reporting limit. Concentration found in the sample was 10 times above the concentration found in the blank. |
| E2 | Concentration estimated. Analyte exceeded calibration range. Reanalysis not performed due to sample matrix. |
| H5 | This test is specified to be performed in the field within 15 minutes of sampling; sample was received and analyzed past the regulatory holding time. |
| T5 | Laboratory not licensed for this parameter |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Case Narrative

Client: Arizona Public Service Company
Project: CCR Groundwater Monitoring

Job ID: 550-218680-1

Job ID: 550-218680-1

Eurofins Phoenix

Job Narrative 550-218680-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 5/21/2024 2:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.8°C and 2.6°C.

HPLC/IC

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 200.8_CWA_LL: The laboratory control sample (LCS) associated with preparation batch 550-321303 and analytical batch 550-321564 was outside acceptance criteria for the analyte Barium. Re-extraction and/or re-analysis could not be performed; therefore, the data have been reported. The batch matrix spike/matrix spike duplicate (MS/MSD) was within acceptance limits and may be used to evaluate matrix performance. FC-CCR-MW81-0524 (550-218680-20), FC-CCR-EW17-0524 (550-218680-21), FC-CCR-EW11R-0524 (550-218680-22) and FC-CCR-EW12R-0524 (550-218680-23)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method 2540C_Calcd: The method blank for analytical batch 550-321537 contained Total Dissolved Solids (TDS) above the reporting limit (RL). Associated sample(s) were not re-analyzed because results were greater than 10X the value found in the method blank.

Method 2540C_Calcd: The analysis volume selected for the following sample produced a base result greater than 200mg before calculation of the final result: FC-CCR-DMX03-0524 (550-218680-2). Reanalysis could not be performed due to holding time exceedance. The reference method specifies that no more than 200mg of weight be recovered for a chosen sample analysis volume in order to produce the best data precision. As such, these data have been qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

 Project/Site: CCR Groundwater Monitoring

Job ID: 550-218680-1
 SDG: APS - Four Corners Power Plant (Other)

Method: 300.0 - Anions, Ion Chromatography

Lab Sample ID: MB 550-321403/2
Matrix: Water
Analysis Batch: 321403

Client Sample ID: Method Blank
Prep Type: Total/NA

| Analyte | MB Result | MB Qualifier | RL | Unit | D | Prepared | Analyzed | Dil Fac |
|----------|-----------|--------------|------|------|---|----------|----------------|---------|
| Chloride | ND | | 2.0 | mg/L | | | 05/23/24 11:44 | 1 |
| Fluoride | ND | | 0.40 | mg/L | | | 05/23/24 11:44 | 1 |
| Sulfate | ND | | 2.0 | mg/L | | | 05/23/24 11:44 | 1 |

Lab Sample ID: LCS 550-321403/5
Matrix: Water
Analysis Batch: 321403

Client Sample ID: Lab Control Sample
Prep Type: Total/NA

| Analyte | Spike Added | LCS Result | LCS Qualifier | Unit | D | %Rec | %Rec Limits |
|----------|-------------|------------|---------------|------|---|------|-------------|
| Chloride | 20.0 | 18.6 | | mg/L | | 93 | 90 - 110 |
| Fluoride | 4.00 | 3.86 | | mg/L | | 97 | 90 - 110 |
| Sulfate | 20.0 | 18.6 | | mg/L | | 93 | 90 - 110 |

Lab Sample ID: LCSD 550-321403/6
Matrix: Water
Analysis Batch: 321403

Client Sample ID: Lab Control Sample Dup
Prep Type: Total/NA

| Analyte | Spike Added | LCSD Result | LCSD Qualifier | Unit | D | %Rec | %Rec Limits | RPD | RPD Limit |
|----------|-------------|-------------|----------------|------|---|------|-------------|-----|-----------|
| Chloride | 20.0 | 19.0 | | mg/L | | 95 | 90 - 110 | 2 | 20 |
| Fluoride | 4.00 | 3.91 | | mg/L | | 98 | 90 - 110 | 1 | 20 |
| Sulfate | 20.0 | 18.9 | | mg/L | | 94 | 90 - 110 | 1 | 20 |

Lab Sample ID: 550-218680-14 MS
Matrix: Water
Analysis Batch: 321403

Client Sample ID: FC-CCR-MW82S-0524
Prep Type: Total/NA

| Analyte | Sample Result | Sample Qualifier | Spike Added | MS Result | MS Qualifier | Unit | D | %Rec | %Rec Limits |
|----------|---------------|------------------|-------------|-----------|--------------|------|---|------|-------------|
| Chloride | 580 | D2 | 4000 | 4280 | D2 | mg/L | | 92 | 80 - 120 |
| Fluoride | ND | | 800 | 769 | D2 | mg/L | | 96 | 80 - 120 |
| Sulfate | 5100 | D2 | 4000 | 8710 | D2 | mg/L | | 89 | 80 - 120 |

Lab Sample ID: 550-218680-14 MSD
Matrix: Water
Analysis Batch: 321403

Client Sample ID: FC-CCR-MW82S-0524
Prep Type: Total/NA

| Analyte | Sample Result | Sample Qualifier | Spike Added | MSD Result | MSD Qualifier | Unit | D | %Rec | %Rec Limits | RPD | RPD Limit |
|----------|---------------|------------------|-------------|------------|---------------|------|---|------|-------------|-----|-----------|
| Chloride | 580 | D2 | 4000 | 4270 | D2 | mg/L | | 92 | 80 - 120 | 0 | 20 |
| Fluoride | ND | | 800 | 768 | D2 | mg/L | | 96 | 80 - 120 | 0 | 20 |
| Sulfate | 5100 | D2 | 4000 | 8710 | D2 | mg/L | | 89 | 80 - 120 | 0 | 20 |

Method: 200.7 Rev 4.4 - Metals (ICP)

Lab Sample ID: MB 550-321295/1-A
Matrix: Water
Analysis Batch: 321545

Client Sample ID: Method Blank
Prep Type: Total/NA
Prep Batch: 321295

| Analyte | MB Result | MB Qualifier | RL | Unit | D | Prepared | Analyzed | Dil Fac |
|---------|-----------|--------------|-------|------|---|----------------|----------------|---------|
| Boron | ND | | 0.050 | mg/L | | 05/22/24 05:43 | 05/25/24 15:30 | 1 |
| Calcium | ND | | 2.0 | mg/L | | 05/22/24 05:43 | 05/25/24 15:30 | 1 |
| Iron | ND | | 0.10 | mg/L | | 05/22/24 05:43 | 05/25/24 15:30 | 1 |

Eurofins Phoenix

QC Sample Results

Client: Arizona Public Service Company
 Project/Site: CCR Groundwater Monitoring

Job ID: 550-218680-1
 SDG: APS - Four Corners Power Plant (Other)

Method: 200.7 Rev 4.4 - Metals (ICP) (Continued)
